In my article in the April issue I hinted that we might be forced to drop our August issue due to sluggish subscription response. However during March and April there was an increase in subscriptions which has brought AC to within a hairsbreadth of its goal of 500 paid subscribers (it now stands at 480). As a result, I've decided to proceed with a full bimonthly schedule of publication for 1993, so we will have an August issue. <Brief pause to allow the applause to die down... .> For more details on this and other encouraging developments please look for my article "Saga of the AC Database" in the upcoming June AC.

By way of titillation here's a peek at the contents of the June issue now in press:

TABLE OF CONTENTS

ATARI CLASSICS Magazine Volume 2 No. 4 June 1993

FEATURES:

Saga Of The AC Database, Part 1
Circulation Editor Ben Poehland delivers Good News for AC readers and describes how database problems almost crippled AC in its infancy.

AC Software Disk Index (June 1993)
AC Disk Editor Steve Hoffee divulges all the goodies awaiting disk subscribers on our June Software Disk.

Modular Programming On The 8-Bit
Contributing Author Ron Fetzer gives us a useful envelope-printing utility while describing a methodical approach to BASIC programming guaranteed to instill self-confidence: a "must read" for beginners!

Super Database 1-2-3
Rolly Herman, Contributing Author, takes us on an in-depth tour of one of the most unusual databases available for your venerable 8-bit.

COLRVIEW: 4096 Simulated Colors On The Classic Atari!
Graphics & Entertainment Editor Jeff Potter describes a mind-blowing technique that pushes the envelope on color graphics in his newest shareware program.

Use A High-Speed Modem On Your Classic Atari
A fascinating look at how your 8-bit can scream as fast as any 486 over the phone lines, from Hardware Editor Charles Cole.

Looking Back: What Is VersaWriter?
Staff Reviewer Gary Matteson steps back in time to examine the most perplexing gadget ever made for the Atari and crosses paths with an Alchemist whose secret identity is shockingly revealed!

COLUMNS:

The Fitting Room
Columnist Mike Jewison finds a Black Box in his Fitting Room and enters a time warp, coming out just this side of Christmas. Huh?

Moonlight Workshop
Staff Columnist Jeff McWilliams continues his Expanded Memory tutorial with a software compatibility chart and uses of RAMdisks.

Exploring The Wild FONTier
A tour-de-force on DD3's text manipulation abilities, graphics, and a User Guide available directly from Columnist Dave Richardson.

The Garret
Columnist Ed Hall explores the best features of text adventures and offers novel ideas for would-be programmers.

Subscription Form

Those of you who don't subscribe can just gaze at the above and drool over what you're missing. It seems there are still quite a few folks out there who don't know the 8-bit community has taken charge of its own affairs by publishing its own bimonthly magazine for $25/year. We don't rely on Atari Corp. any more. Nor ANTIC. Nor Analog. Nor Explorer. We stand on our own feet and do the job ourselves.

If you're tired of being left in the cold, join the Bold New Experiment that AC represents. At ATARI CLASSICS, you aren't just a subscriber: you are a Participant in a New Idea. We are demonstrating to the morons in Sunnyvale, and to the whole rest of the world, that a community of users can exist independent of the company whose product first drew us together.

For subscription info, please write: ATARI CLASSICS

1623. April AC Article: OK To Post Here?

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-23 17:51:37 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9305231733.AA04079@smithkline.com>
Source record: 106834

Hello Everyone,

In the April AC I presented an article/editorial entitled "Us Guys Iz Yooze Guys: A Status Report On The AC Experiment". Several people, including AC's Telecom Editor Lawrence Estep, have requested me to post the article on various nets, which I have agreed to do.

However, the thing is pretty long for posting to directly to the newsgroup, it runs like 23K of text (4 pages in the magazine). I'm a little reluctant to post it here because of that. I know some folks have to pay for Net access & a big file like that will chew up not only memory allocation but $$$ as well. The file will be made available in ARC'd form on the commercial nets.

Gimme some feedback here, yay or nay, I'll be glad to post it in 80-col format if I get enough positive response. I'll wait a week & see...

To answer your question about hooking up an internal 3.5" drive to an 8bit...I have that here...I got it by using the Dual Drive ☐{ conversion from CSS [716-247-5639]. It converts the standard XF551 to a very fast 3.5" 720k drive...I'm using both the 5 1/4" and the 3 1/2" on the same controller inside my hard drive case which is an ibm type minitower..this mod uses chips and a module that do away with the XF551s problems and make faster than ICDs ultra speed.
I use Sparta X or Sparta 3.2d on it.
If you get a Black Box you can run 5 1/4" and 3 1/2" HD disk drives (1.2 meg and 1.44 meg respectively) with lightning speed cuz its off the parallel port with the Black box. This is more expensive.
OH yes, Mydos 4.5 or more can format HD disks.

Atari 8 bit owners!

Upgrades and repairs done to all Atari 8 bit equipment!

Memory upgrades upto 4MB!
Drive Upgrades
Computer REPAIR
Drive REPAIR
Keyboard Replacement
ROM & OS Upgrades
Gumby Stereo Upgrade!
Video-Clear Upgrade (xl)!

Custom mods! You request it, we do it!

WE CARRY A FULL LINE OF ALL ATARI 8 BIT EQUIPMENT!

WE DO INSTALLATION ON EVERYTHING WE SELL!

Called around for an item but found the company who sells it
wants WAY too much to install it???

NO PROBLEM! We can get that part for you and install it for less
that they will!

LOWEST prices for all atari service & upgrades, GUARANTEED!

E-Mail for a price quote on that upgrade you want NOW!

IMMED REPLY!

1626. Problems with 600XL keyboard -> Solved!

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-23 19:16:06 UTC
From: dbstrutt@acs.ucalgary.ca
Message-ID: <93May23.191606.43087@acs.ucalgary.ca>
Source record: 106784

I thought I would update the situation with my 600xl keyboard for anyone who might be interested. To recap, banks of the keys did not work, the example I gave being 3-E-D-C which fall on a diagonal line on the keyboard. Inspecting the innards of the keyboard showed that the keys that didn't work fell along lines on part of the mylar template under the keyboard. A helpful person pointed me to the 4051 cmos chips which connect to the keyboard bus. Sure enough, exchanging the chips changed the keys that worked/didn't work. So clearly one of the chips is fried. And best of all (no pun intended) Best carries the chips for only $.69 each. Thank god I didn't need to replace the keyboard mylar, Best charges $22! Well anyways thanks to those who tried to help.

1627. Atari stuff(hardware,software,books) SALE

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-23 19:35:21 UTC
From: cohen@BORN.phys.virginia.edu
Message-ID: <0096CF08.562435A0@BORN.PHYS.VIRGINIA.EDU>
Source record: 106840

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).
I will respond to every e-mail message I get here (if you get no response,
please try again). PLEASE FEEL FREE to make any offer! I intend to finalize
sales within a few days, and will accept immediately offers that look very good
(if there will be any).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Atari CX853 16K RAM memory module for Atari 800 (I have 2 units)
Axlon RAM CRAM 32K memory module for Atari 800
Atari 850 Expansion Interface, like-new condition
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
MPP CARD?/AT centronics parallel printer interface (hooks up a standard parallel
printer to Atari I/O port, no need for 850 unit).
Atari power supply model # C061982 (for the XL/XE series I think).
Atari 1027 Letter Quality 80-column impact printer in excellent condition,
in original box with all cables and manuals
Another 1027 Letter Quality printer almost new, in original box, but does
not work properly
Atari 1020 Color Printer/plotter in original box, manual, all cables.
Another Atari 1020 color printer/ plotter with manual.
Yet another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Joysticks- various types and shapes, all tested and working well.
Paddles- a pair of Atari paddles - NEW never used
Paddles- a pair of Atari paddles - used
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)
Atari 1010 Program Recorder - I have 2 units, Work fine.
Atari 1010 Program Recorder - save: ok, load: no.

4 DISK DRIVES-
2 Atari 1050 drives, 2 Atari 810 drives, all sold as is.

They had various levels of problems, the 1050 spins and the light comes up
but it won't load, and one 1050 and one of the 810 were dead as I recall.

***** SOFTWARE *****

Cartridges-
==========

BASIC (CXL4002) with manual
Thorn EMI Submarine Commander with manual and original box
Imagic Atlantis with manual and original box
Centipede with instructions
Missile Command
Activision Space Shuttle
Imagic Demon Attack
AtariArtist cartridge
AtariWriter Wordprocessor with manuals and original box

Disks- (All are original disks)
======

Lode Runner with manual and original box
TimeWise with manual and original box
Epyx Summer Games with manual and original box
Strategic Simulations Inc. Computer Baseball with manual and original box
Temple of Apshai with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Pinball Construction set with original binder and manual
Infocom Zork I with manual and original box
Micro League Baseball with manual and original box
Micro League Baseball General Manager/Owners Disk with original box
Spare Change with manual
The seven Cities of Gold
Atari Translator
Ghostbuster by Activision
Atari DOS 2.5 with manual

plus about 100 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
Joystick Sketchpad with manual (used)
apx Eastern Front 1941 (with manual and original box)
Thorn EMI Compute 4 and Reversi (in original box with instructions)
Atari Statistics I (with manual and original box)

Books-
======

Bill Carris- Inside Atari BASIC
Compute!'s First Book of Atari
Compute!'s Second Book of Atari
Gardner- Software Protection and Code Breaking (book only)
ICD SpartaDOS Construction Set
Your Atari Computer
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition

Source record: 106838

I understand that you can connect an ST mouse to the 8bit. How many people have done this to their 8-bit. Also, once you have a mouse hooked up, what software supports it? Is there very much software support for it? How much does an ST mouse cost?

Thanks,
Lance "Ate_bit" Murdock

Well... hmmm... I believe I tried that TURBOMOD.TUR (turboBASIC XL file)
on BOTH the TurboBASIC on the AC disk AND on my "master DOS disk"...

the TurboBASIC XL >I< have >IS< at 60 cycle ... the COMPILER isnt tho.

AND, I >DO< have the normal "READY" prompt...
not the "Jouh!" or the "TURBO" prompt..

SX212's handler (I use the BobVerter) doesnt work tho...! :(

HELP!
what >AM< I doing wrong!?!?!?

RE: connecting a 3.5" 1.44meg drive to an Atari 8bit computer.

1- I know of no easy way to connect to any internal drive while it is still installed (and presumably in use) in a PC. You would have to put in a switch to change the drive between the machines.

Of course you could always access the drive AS A PC DRIVE, by redirecting the CON device (console) on the PC to a serial port, then using an Atari with an 850 (or equivalent) and terminal software. You would be able to run line (as opposed to full screen) oriented programs on the PC and control them from the Atari (like DOS, or EDLIN). You could also then transfer files between the two systems.

2- BTW, a XT class PC cannot generally support a high density drive in high density mode (i.e., 1.44meg 3.5", or 1.2meg 5.25"). The required data transfer rate is too high for an 8bit bus. There are special controllers available for a XT that buffer the I/O. Unless this type of controller is available for the Atari 8bit machines, I seriously doubt the ability to use a 3.5" drive at 1.44meg.

Hey man, we've been doing just that for ages over here in the UK, with no
support from Atari UK, just good old Page 6, 10 years and still
going strong! And lots of dedicated users. Last time I wrote to Atari UK
(which was around 3 years ago) I got a letter from them pointing me towards
Silica Shop. Just two little details:

1) The question I was asking had nothing to do with Silica Shop in the first
place and everything to do with Atari UK.

2) Silica Shop had virtualy dropped all support for the 8-bit.

Conclusion: they didn't give a damn.

>If you're tired of being left in the cold, join the Bold New Experiment that
>AC represents. At ATARI CLASSICS, you aren't just a subscriber: you are a
>Participant in a New Idea. We are demonstrating to the morons in Sunnyvale,
>and to the whole rest of the world, that a community of users can exist
^^^^^^^^^^^^^^^^^^^^^^
>independent of the company whose product first drew us together.

You're showing us???!!!??!?!?!? :-) :-) :-)

Bold New Experiment?, Bold definitely, Experiment yes, New??? :-) :-)

OK, OK, I'm not trying to start a major flame going here, just pointing out
that we are in exactly the same boat over here.

I also realise that this post is something of an advert for AC, and therefore
bound to be a little over the top, but still! :-)

The point of this post?
I'm not trying to dampen anbody's spirits, or put AC down (good grief no! you
deserve all the encouragement you can get), just pointing out the we feel
lonely over here too, and that even though Atari started in the U.S.A. we
are a world wide community now, fact which can be seen in this newsgroup,just
check out where some of the postings come from.

Just wanted to get all this off my chest, sorry for wasting bandwidth.

Raphael Espino - British Atari 8-bit owner and proud of it too!

I too have had problems with 130XE keyboards and it was the E,D,C,3,0 keys which died on me. As of yet I have not been able to fix them, but the ideas suggested in an earlier posting will certainly help. One way of testing the keyboard decoder chip is to plug in a second keyboard (assuming you can get) hold of one (ask a friend to borrow his/hers) and seeing if the problem persists. I had two 130XE's and on changing keyboards from the one with faulty E,D,C etc to another keyboard I found all the main keys worked fine but the function keys START, SELECT and OPTION!

About this RT8 clone, are you sure BEST are developing it? I know a guy here in England - Derek Fern - who keeps telling me he is doing one and I know he does some dealings with BEST.

Does anybody know how much BEST want for a light gun and whether they ship to the UK or not? Also do they credit card orders over the phone? A touchy subject on this digest I know but it is the best (no pun intended) way for us people in the UK to order things from the states.

I had my 130XE apart the other day, and I noticed the 1.43MHz. (I think)
crystal inside it. I also just finished reading the advocacy article
which mentioned the 6502 powered Nintendo that runs at 4 MHz. My question:
What would happen if I swapped my crystal for something around 3-4MHz?
I have heard of IBM'ers changing their crystals and getting impressive results
(such as a 486/50 running at 80MHz!) Granted, if such an upgade were to occur,
heat dissipation would have to be taken into consideration, but even if you
burned up a couple of 6502's, I think they only cost a few $$ to replace.
Let me know what you think...

While I'm no expert I can't see why this wouldn't be possible. I know JDR
microdevices (or perhaps it was Jameco) sell 6502 rated at 4Mhz. The only
problem I see is that perhaps some other things use that crystal for timing
also.
If you try it let me know how things turn out...

1652. 3.5" Drives

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-24 19:27:07 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9305241833.AA12266@smithkline.com>
Source record: 106861

I'm using BOTH 1.44-meg & 720K 3.5" floppies in the main system I use to run Atari Classics.

The only DOS's that support 1.44M & 720K are MyDOS & the various flavors of SpartaDOS. 1.44M drives can only be used on the PBI as the require a special format that's only available from firmware built into the Black Box/Floppy Board combo from Computer Software Services, which plugs into the PBI/ECI on the XL/XE.

The quad-density (720K) 3.5" floppies can be used as slaves to to XF-551 drive on the SIO. Again you must have MyDOS or Sparta to format those. Both the HD & QD floppies support ultraspeed file transfers, although the formatting routine using the BB/FB is noticeably faster than formatting just with Sparta U/S alone.

The 720K units can read MSDOS/ST formats using utility software provided by CSS. The 1.44M PBI BB/FB floppies can read, write, & format MSDOS/ST formats.

The XF-551 upgrade is available in several flavors. You can just replace the 5.25" mech with a 3.5", or you can slave the 3.5" externally to the existing 5.25" mech, or you can run two 3.5" drives (internal & external). The combo I find most useful is the 3.5" slaved to the existing 5.25". My 5.25" mech is also modified with the CSS Enhancement, which makes the 5.25" mech completely compatible with the 1050 at the flick of a switch. I use this mostly for reading DOS 2.5 formatted floppies that people send to the magazine. The 3.5" slave is a useful backup in case I suffer catastrophic failure of the BB/FB, which would take my 44-meg hard drive & all my 1.44-meg floppies out in one swoop (!).

With the BB/FB you can connect up to 4 floppies of all manner configuration: 3.5" QD or HD, 5.25" DD or HD, & even I think 8" (ugh!). These are all standard IBM-type floppy mechs, off-the-shelf stuff you can pick up anywhere.

There is supposedly another way of connecting up 3.5" QD floppies, I've never tried it. A few people have reported that you can replace the 5.25" mech in later-model Percom DS/DD drives with the std. 3.5" mechs & they will work outright. No warranties there, that's heresay. Anyone out there want to verify that?

The nice thing about the 1.44M PBI floppies is that they will of course also read/write to disks formatted with the slaved 720K drives on the SIO. All new 3.5" mechs sold these days have built-in media sensing & automatically adjust their bias currents for QD or HD. Of course the QD mechs won't read HD formats. Once you get used to using 3.5" floppies, using even a U/S Doubled 1050 seems like the Stone Age. And a stock SS/SD 810- ugh! Strictly Jurassic!

The only thing better than 3.5" floppies is a hard drive or maybe a monster RAMdisk. I've been using the BB/FB for over a year & I *LOVE* it!

I like this hardware so much, if CSS sold one with chocolate icing I would EAT the darn thing!

Which reminds me, I'm running a 2-part article beginning in the June AC describing how I use all this stuff to manage circulation for Atari Classics. This AM I mailed off to our Publisher 511 mailing labels for the June issue, plus another list of 290 labels I generated last week for our software disk. Without this fancy hardware AC simply could not exist, the amounts of data I'm slugging thru that little bitty 6502 in my 800XL are truly staggering.

The operation of the custom chips on the atari (Antic, GITA, and Pokey)
are closely tied to the clock. If you sped up the clock these chips
would not operate properly.
This (or so I've heard) is why the T-816 board was unable to be clocked
past the 1.4Mhz

1655. Page6 N.A.U. vs AC

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-24 21:38:10 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9305242024.AA13411@smithkline.com>
Source record: 106864

In a recent post Raphael Espino feels that AC really isn't anything all that new & that Page6 has been doing for years what we are just now doing with AC.

I have a different point of view.

First, Page6 was founded during the heyday of the 8bit. It was thus able to establish itself in a market where resources were plentiful & there was considerable support from Atari Corp. (at least in the beginning). AC only came into existence last year, at a time when the market has very little resources & virtually no support from Atari. That we exist at all, in fact are growing, is nothing short of a miracle.

Second, Page6 is a commercial operation. Its publishers may be considered professionals, as they pretty much earn their living from the mag. Whereas AC is literally owned & operated by the 8-bit community at large. The Staff is not paid a salary, people scattered literally all over the world make up the Staff & contribute to it in their spare time. The logistics involved are hideous. As opposed to Page6, where all their resources are pretty much concentrated & the market they serve is fairly compact. AC's resources are scattered all over the place, as is the market it serves (including 30 subscribers in the UK).

I can't comment on market conditions in the UK, but Atari's official abandonment of the Classic machines beginning in 1992 came as rude shock in the wake of a market that was already suffering catastrophic decline. Whereas Page6 was begun as a business enterprise by its proprietors, AC was begun BY THE 8-BIT COMMUNITY ITSELF- in deliberate response to the official rejection by Atari & as a means of attempting to salvage what was left of the North American market. The odds were against us from the beginning, & still are.

I don't mean to say that British 8-bitters have suffered any less than 8-bitters everywhere else. But Page6 operates in a business climate roughly similar to that of the former American magazines (ANTIC, Analog, etc.) which have passed out of existence. The same thing could happen to Page6. Suppose Page6 folded up the way the American mags did? I think it's a mistake to base one's own sense of market security on a private enterprise over which you have no direct control. Such security as now exists in the North American market is directly a function of participation by the community as a whole. I suspect the British market would suffer a catastrophe at the hands of Page6 if Page6 collapsed. But with control of AC directly in the hands of the user community, it is we ourselves who control the market (what remains of it). And from what I can see the novel enterprise that AC represents is beginning to have an effect. The bloodletting in our vendor community is now showing signs of bottoming out, & there are even a few new startup operations trying to make a go of it using AC as their vehicle.

Both in terms of philosophical conception & administrative operation, AC & Page6 are nothing alike. In fact AC is unlike any other publication that ever existed- past or present- in the Atari market.

As such, I reiterate my claim that AC DOES represent a New Idea: that we should persist as a community & a marketplace in the face of official disenfranchisement from the company that drew us together. Page6 deserves credit for its success (so far) in riding out the storm of market decline. But AC is altogether a different story, a deliberate effort springing from a grass-roots movement in the user community at large. This has not been tried before.

AC represents the testing of a new formula for survival.

Message-ID: <Jeff_Mcwilliams.0gyv@abcd.houghton.mi.us>
Source record: 106866

Lance,

Sorry I couldn't directly reply to your previous message on this topic,
it appears in the digest but not to this newsreader.

Anyhow, the Antic and GTIA chips which are responsible for generating the
video display are very closely tied with the clock speed. The clock speed
of the 8 bit isn't arbitrary, it's either twice, or half the NTSC
frequency (or something like that.. Alchemist, care to embellish?)

You would need some really special circuitry to increase the clock speed.
You can get the chips though. Western Design Center makes 6502
compatible CPUs, with more features, as fast as 10mHz.
I talked to Bob Puff about this once, and he said it's doable, but it would
end up costing about $300.00 apiece for an accelerator board.
Unless every A.C. subscriber purchased one, I doubt you'll see a
C.S.S. clock accelerator card anywhere in the near or distant future.

: Thanks, Mike

What is a TRAK drive, where did you get it, and what makes it stand out from anything else? Sounds interesting that you can add a slave drive to it.

Its a double sided double density drive for the Atari that has a built in centronics parallel port for a printer and (Supposedly) the ability to hook up another drive to the internal floppy controller for the Atari

(On the back it has a 34 pin male connector labeled SLAVE DRIVE

I got it with a package purchase at a flea market...

Are there any methods that the 8-bit can receive weather satellite photos from the Internet? I have an article from Modern Electronics where satellite photos can be received, and I also read an Antic (or Analog, but Antic I think) article that explained a way to do it with shortwave receivers. I was curious if there was another way to do this without a receiver. I have a friend that is a pilot that can access weather photos for his computer, but unfortunately, you have to be a certified pilot to do this. I was hoping that there might be a site where up-to-date photos can be received.

Just another Summer project I had in mind for my 8-bit...

I installed the StereoXL upgrade and now have downloaded the Gumby.BAS
stereo player, but i cant get it to play anything.

The regular pokey player plays fine, but the gumby player just displays
the song title and immed jumps back to the start, ive used ML and
have verified that both my pokey chips are working just fine.

Any tips?

Steve

>much does an ST mouse cost?

There are a lot of products from PPP that support the ST mouse:

SAM - the application software system with 80 characters per line, windows,
pull down menues and so on (something like GEM of the ATARI ST).

QUICK - the fast programming language

QUICK Ed - a character set editor for the joystick, mouse and touch tablet

Mine Sweeper - You know that game?

PPP products are now available in an international version in the UK and US.

Jeff,

> Anyhow, the Antic and GTIA chips which are responsible for generating the
> video display are very closely tied with the clock speed. The clock speed
> of the 8 bit isn't arbitrary, it's either twice, or half the NTSC
> frequency (or something like that.. Alchemist, care to embellish?)

How are the Antic GTIA chips tied with the clock speed? Last
time I looked at the service manual for the XE game system
(I guess the ordinary XL/XE is pretty much the same) and at the
schematics. I discovered that you have exactly the same schematics
for PAL and NTSC. The two versions just distinguish themselves by
the value of some capacitors/resistors within the GTIA/ANTIC
timing circuitry. I don't remember any connections between the
main system clock and the video circuits except for the PHI and
PHI2 signals on the bus. I don't think that these signals are
responsible for the video output in any way.
I guess their purpose is just for synchronisation reasons on the
processor bus i.e. getting bytes from RAM at the right time.

Since the clock frequency of NTSC is 60 Hz, the 8-bit clock
can't be half or twice as high as the frequency of NTSC.
My manual lists the clock speed of my 130XE with 1.79MHz which
is 29833 times the NTSC clock or 35800 times as high as my PAL
clock. Even if you think about the line frequency of 15.6???? kHz
I don't think it's something to do with the main clock rate.

You can't just put in a different crystal with a higher speed anyway.
Like a faster CPU you'd have to find also a version of ANTIC, GTIA
POKEY, PIA which can run with say 4MHz unless you want to
cook eggs on your chips or you are interested in watching the cloud
of smoke comming out of your modified 8-bit.

If you'd like to upgrade your XL/XE machine you'll need to start
a production line for 4MHz 6502C CPUs which are different from
the available ordinary 6502 CPUs.
Of course you could try to glue some logic in order to emulate
the pinout of the 6502C CPU, but this would still be the minor problem
(look above)

> end up costing about $300.00 apiece for an accelerator board.

maybe more
The best approach for more speed in my opinion is a coprocessor
board like the Turbo(?) 816 or similar. It wouldn't be so expencive
too.

I have a couple of TRAK drives, one I bought new in ~84 and one I
bought "smoked" for pocket change. The drive controller is basically
the same on all TRAK drives, but the code in the EPROMS probably
varies widely. Are you sure the one you have is DS/DD and not SS/DD?
Both of mine are SS/DD, and as I recall TRAK went under right about
the time they released DS/DD.

I've succesfully hooked up slave drives to my TRAKs, but only in SS
mode. I suspect that you could get it to control a 3.5, but probably
only in SingleSided 40 Track mode, unless you have DS ROMS in your
controller. I would be really suprised if it could deal with all
80 tracks of an 80 track drive. (And then I would begin begging you
to burn me a copy of the from your controller EPROMS!)

What you need to do-

Provide power to the slave drive, and use a standard ribbon cable
(ala PC clone) ftom the "box" connector on the TRAK to the slave
drive. NOTE!!!!! Don't use the TRAK to try to power the second drive,
it won't handle it. You'll need to Jumper the slave drive to be drive
2,

What I did and why-

I bought a 2 drive case/power that supported two 1/2 height
drives. I removed the drive mechanism from the TRAK and installed
both mechanisms in the case, put a blank panel on the TRAK, and
it works great. The TRAK power supply is marginal, and by removing the
drive mechanism and powering it in the other case, the PS in the
TRAK only has to provide current for the controller electronics and

thus runs a whole lot cooler, and has lasted almost 10 years.

TRAK really cut corners when they were going under, the models
"right at the end" were missing the large electrolytic caps in
the power supply. You might want to open the drive and see if they're
there. If not, I could provide the values and you might consider
installing them.

By the way, the printer port function on the TRAK is really good, it
intellegently uses the track buffering RAM as a print spooler, so
printing via the TRAK is serial bus speed for short print jobs, (Until
you run out of buffer RAM)

> software supports it? Is there very much software support for it? How
> much does an ST mouse cost?

I've got one. I've bought it for 50DM which is now about $29.
Actually it's a Genius Mouse with a switch at the bottom allowing you
to switch between the ST and Amiga modes.

I use it in the ST mode though.

You can find some programs supporting a mouse now. Last weekend
I tried the demo version of Mine Sweeper from the archive.
This game can be played with a mouse as well. I guess I spent
more than 6 hours playing this game. Without a mouse it wouldn't be
so interesting.
Do you want more programs with mouse control? Get Quick.
This programming language provides a command for mouse control.
That way all programs you write can be controlled by a mouse.

Lance,

I saw an FTP site when playing with a gopher application a few weeks ago,
but I didn't write down the name of the site. If I come across it again,
I'll post it here. You might want to post something to
comp.graphics, somebody there is bound to have this information, and in fact
I've seen others asking the same questions a while back.
For now you would need to get the files in GIF format, and get Jeff Potter's
excellent programs for converting and viewing GIF files.
There is a possibility that in the near future we might see a TIFF
file printing utility, which would allow you to print a TIFF to your
printer.

The screen refresh rate is different from the colorburst frequency,
which more or less determines the horizontal resolution of the display.

Ever hear of wait states?

I am planning on buying a TI DSP evaluation board sometime this
summer (they're listed at $99). This includes a 20-40 MIPS processor,
a little RAM, a serial port, a cross-assembler that I assume runs under
MSDOS, A/D and D/A converters with nice little RCA jacks all ready to go,
and room on the board for your own stuff. I plan to eventually build at
least a parallel interface to my 8-bit for it. I believe, though this is
a long shot, that it may be possible to build a high speed classic Atari
if you ditch the ANTIC, keep the GTIA, and use a DSP running in parallel
(DMA, just like the ANTIC) to emulate the ANTIC, as well as for FP, digital
audio, etc. It may be possible for such a custom ANTIC replacement to
kernel the GTIA fast enough to get more colors on screen at once than
usual... GR.8 APAC, anyone? The whole implementation would be a MAJOR
headache though... depending on how successful I am getting the TI board
to work (if I can ever get my hands on one to start with) with my 8-bit
I may start trying some stuff like rewriting the FP routines to talk
to the DSP and maybe even seeing if I can get the DSP to kernel the GTIA
on one of my spare machines (disconnecting the GTIA from the address
and data bus first- I am not going to implement a DMA interface) from
its own memory. Again, implementing a DMA interface and a clean, transparent
emulation of the ANTIC would be a major headache, but I think contemporary
DSPs could handle it with time to spare for all the other nifty things you
can do with a DSP. Plus one could implement better movable object blocks
than player-missiles. :)

This is not difficult- I have 800's with both the 6502 and the 6502C,
the difference is only a couple of logic chips, and the processor cards
look the same to the rest of the machine. Again, a decent design will
be able to wait for the old I/O chips..

Well, if your friend has access to a system that will allow him to upload
and download things into a personal directy (like a UNIX based system or
such).

What I would then do is upload all the Atari files to this system, and
then download them onto whatever computer system he/she is using.

This saves the time, expense and technical migraines involved in jerry
rigging a system through the Atari 8-bit....

One final note, all the wordprocessing files on the Atari 8-bit side
should be translated to ASCII _before_ uploading it to avoid any file
translation problems. You can also set up a null-modem cable between the
two machines and transfer files this way.....

Source record: 106890

I remember reading the following announcement back in February, but
haven't seen the mentioned files in the "0index" file. Are they up
somewhere?

Well I hope everything went well, when I grabbed the source from the
Sun and the binaries from my Atari, but since I am under intense
time pressure and I needed to get this stuff out, finally I have
released it today.

Just a rundown of the features:

o Crossassembler for 6502
- produced linkable code
- code is runtime relocatable, no more Page 6 blues
- is MAC65 compatible
- does everything you want, and better than you expect

o Linker
- produces Bootsectors (if asked to)
o Librarian

o Mac65 detokenizer

o Disassembler

o Binaryconverter for C64 and AppleII (should work)

o and two or three more goodies.

This "nasm 2.0" package was supposed to be in the umich archive in
the nasm20 folder. Are they there, and I'm just looking in the
wrong place?

> video display are very closely tied with the clock speed. The clock speed

Jeff,

In theory, one could add a separate processor on a
different and isolated 64k block of address space (separate board)
and make it say 4 times the clock speed of the main cpu. This
board would be clocked by a precision crystal, and divided down to
provide the clock signal for the main cpu- to maintain risetime
syncronysity on the two A/D busses. There could be a section of
memory which is written to by the High Speed processor which the
low speed processor could copy to the display list area, and
update I/O registers- thusly, one could run stuff FASTER and still
emulate an Atari 100%. This shared (say 16k block) of memory
space could be enabled and disabled with a toggle, or device call
from software (store to memory location).

The major reason why the ATari is fixed that the clock
speed it is (1/2 the colorburst frequency) is because the actual
clock is used to generate ALL the signals in the GTIA, and if you
ran even a skoosh faster, it would cause horizontal and color
phase misalignment with the TV. Everything is built around the
restrictions of a standard TV video signal.............sq

(colorburst frequency for TV's is 3.579545Mhz. The actual clock
speed of the 6502 is half that due to the fact it uses a two phase
clock signal, each which is Q and Qnot of a JK flip-flop clocked
from the base frequency. Actual Atari clock speed is 1.7something
megahertz- just divide 3,579,545 Hertz in two to get the actual
CPU clock speed for the Atari. I haven't a calculator handy...)

I have another idea, suprised I hadn't thought of it years ago. One could simply change out the crystal with a clock board, one that has say a divide by 10 chip on it, and use a custom crystal cut to 35.795450Mhz. By selecting how much divide by you have, you could shoot your CPU speed up accordingly. Make it a divide by five (by changing one interconnect on the chip, I'm thinking a 74LS190 here- hope I have that decade counter chip number right, anyway- move it to a divide by five, and double your CPU speed.

The obvious would of course happen, your screen would go to hell- or you may even lock-up your Antic, GTIA and POKEY! Simple solution, tri-state them! Take them off line for the "jump to hyperspace". That way, with a software toggle,you could Shut down the external devices, jump to high speed to process some given piece of code, then jump back putting them back on the bus. Tri-state bi-directional bus drivers should work ok to knock everyone off the bus for these "hyperlight" jumps. If 6502 processor clones are available fast enough, even run it at the base rate of 10 times faster or 17 Megahertz!

Since this is all toggled by software, the jumps could occur hundreds of times a second and even go unnoticed by us slow humans! It would simply make your computer into a SUPER computer. The hack wouldn't even be all that difficult, a radio shack protoboard of about 5cm square, a new crystal and hex buffer to generate a clock signal and a divide by 10 (decade counter) chip, selectable with a BCD to DECimal converter tied into a free memory space somewhere for the "poke to envoke" command.

Since I seem to have lost 100% of my Atari motivation, can't even bring myself to dig my old 800 out of the box, let alone hack on it- it is up to you guys to build this thing.....sq

(I will provide moral support....)

((...and don't forget to use faster RAM chips with a faster clone 6502 CPU. Nasty lock-ups occur unless you do. But 64k of ram is

cheap today! I remember when 8k by 8 ram modules were 150
bucks!))

LM> 4MHz?
LM> I have heard of IBM'ers changing their crystals and getting
LM> impressive results

This has gone by a few times before, but again: it is not a reasonable
upgrade to an Atari 8bit to increase the clock speed.

The Atari uses one clock speed for the entire system which is sync'ed with
the standard (NTSC or PAL) used for TV. The Atari actually uses several
microprocessors. The 6502 runs the instruction code, and the ANTIC runs
special code called the Display List. The reason the 6502 must run as the
same speed as the ANTIC is they access the same memory. Since only one
processor can use dynamic RAM at one time, the processors must synchronize
to share the access, and since the ANTIC must work at TV frequencies
through GTIA, the 6502 must work at this speed too.

Of course you COULD totally redo the circuit so only the 6502 runs at an
exact multiple of this frequency, but it isn't worth it.

With the advent of the first AT that exceeded 10Mhz, the ISA bus in the PC
world has had its own timing logic separate from the CPU clock. This has
pros & cons. Yes you can fool around with 'pushing' the CPU & RAM to higher
speeds. The downside is the ISA bus now acts as a bottleneck running at
8-10MHz and 16bit data width, with the CPU running up to 50MHz at 32bit
data width. In many high density, high color graphics programs, the CPU
spends a fair amount of time just waiting for the video subsystem to finish
displaying the data.

There are some work arounds, but that goes beyond the scope of this
response.

Floating point operations on the Atari are the easiest of any of the 8bit
machines to implement - why? Its the only machine that bothered to put them
into the OS ROM. The others implemented them either in ROM BASIC or disk
BASIC, which meant you build your own routines in assembler or make machine
language calls to BASIC (tacky and slow).

Source record: 106658

MT>I just got a full 800 system with 810,850 etc and I don't have any
MT>information for the 850 and I need to build a cable so I can transfer
MT>software to my Atari... So I need the pin outs for the 4 serial ports
MT>on the 850...

If you hold the 850 so you are looking at the 4 serial ports, port #1 is on
the right, port #4 is on the left.
In all 4 serial ports Pin #1 is in the upper right hand corner,#5 is
in the upper left hand corner, #6 is lower right, and #9 is lower left.

According to the 850 Interface Manual the pin functions are:

Port #1

Pin #1 DTR
Pin #2 CRX(aka Carrier Detect)
Pin #3 XMIT
Pin #4 RECEIVE
Pin #5 Signal Ground
Pin #6 DSR
Pin #7 RTS
Pin #8 CTS
Pin #9 is not utilized

Ports #2 and #3

Pin #1 DTR
Pin #3 XMIT
Pin #4 RECEIVE
Pin #5 Signal Ground
Pin #6 DSR

Port #4

Pin #1 DTR *
Pin #3 XMIT
Pin #4 RECEIVE
Pin #5 Signal Ground
Pin #7 RTS *
Pin #9 -8v(I don't know what this is for)
* = These pins are NOT computer controlled and are always ON(+10v)

To hook up port #4 with a 20 mA(milliamp device:

Port #1 Send data +
Port #3 Send Data -
Port #7 Receive Data +

Port #9 Receive Data -

All of the comm programs I have seen(Express, Bobterm, Determ) utilize serial port #1(although Bobterm does allow you to use port #2).

Source record: 106756

Uh, oh boy, without the Tech Notes in front of me I'll have to wing it here. There is an elaborate description in the 400/800 Tech Notes about how Atari arrived at the 1.79MHz clock speed for the Classic 8bits. The details are long faded from my memory, but basically the entire machine is built around the timing sequences required for the NTSC color signal. The NTSC colorburst signal is 3.58MHz, exactly twice the frequency of the of the CPU clock. A lot of other video sync info is derived from the clock by various counter/divider circuits.

At the MINIMUM, any attempt to monkey with the CPU clock is going to turn your video display into scrambled eggs.

It's also highly probable that increasing the clock frequency will burn out the LSI support chips. You might be able to find hi-freq versions of the PIA & CPU somewhere, but ANTIC & GTIA are pretty well cast in stone.

The frustrating part of this idea is that I don't think increasing the clock would actually interfere with the machine's computing ability (that's just speculation). It's the output circuits that can't keep up. It does you absolutely no good to have your CPU screaming along at super-whizzy speed it if the CPU output gets crunched on the way to the user & all you see is gibberish accompanied by smoke.

Conceptually, yes,I agree, I think it would be POSSIBLE to build some sort of accelerator. But whoever did it would first have to sell their soul to the Devil.

Bottom line: don't mess with the clock!

- BEN POEHLAND

|> timing circuitry. I don't remember any connections between the
|> main system clock and the video circuits except for the PHI and
|> PHI2 signals on the bus. I don't think that these signals are
|> responsible for the video output in any way.

The NTSC version of the 800XL uses a 3.58 MHz crystal, creating a 1.79 MHz clock for the 6502. The PAL version uses a 4.43 MHz crystal. Blank areas on either motherboard are reserved for the other crystal, and a few support parts. GTIA/ANTIC and the other circuits are locked into running at these rates. Any speedups to the processor must allow the other LSI chips to run at the appropriate rate.

|> You can't just put in a different crystal with a higher speed anyway.

I doubt your LSI parts would burn up or cause a cloud of smoke. They might get a little warmer, but would just be smiling back at you as you try to make them run faster than they were designed.

You can slow down the timing opn an 8-bit a little (from what I've
heard), but you can't speed it up because the sync signals are really
tight & the're already at the minimum. If your willing to accept the
screen rolling so bad you can't read it, it would work. If you're already
doing stuff like turning the screen off to speed up processing it's
feasible you could have a programable divide circuit for the timer.
IMHO: Not one heck of a lot of applications it would be suitable with.

1701. The Turbo Atari 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-26 19:54:53 UTC
From: theclub!conklin@egr.msu.edu
Message-ID: <9305261955.AA05170@forest.egr.msu.edu>
Source record: 106758

I want to post this because I see discussion again coming around to the popular Turbo Atari 8-bit, in the sense of increasing the clock speed. This is a project I'm very familiar with because I put some serious effort into it. I have a TRS-80 Model 1 that I have pushed to 300% of design speed.

This is an engineers article. I.e. if you primarily work in BASIC, it's probably way out there. I want to post specifics because I got very close, but haven't had time to continue. Specifically, when another major 8-bit fan and generally bright boy Ken Sumrall and I got to working on it together we got as far as the following:

1.) The purpose of a speed-up mod is, quite simply, to crank the CPU clock and thus boost performance. Like IBM compatibles, and TRS-80s before them, you get a more or less linear speed increase. I.E. double the clock is twice speed

2.) On the Atari, until a few years back, 6502 processors were not available in higher speeds. The Atari 6502 is running at 1.7+ Mhz, essentially 2 Mhz. This is actually pretty quick for a 6502, which gets a lot of milage out of a given clock cycle much like a RISC chip. The natural speed increase, 100% or a jump to 3.5+ Mhz requires a 4 Mhz rated 6502. This is now avaiable.

In a previous article, d1dol@dtek.chalmers.se (Fredrik Lundholm) says:

>Atari declared all their 8 bit programs pd 1988 here in sweden to
>raise popularity of the computer.

That's bizarre. How can they make software PD in one country, but keep it
commercial in another? Don't they expect us to be networked together?

Atari made an Arcade game that used "paddle" controllers called "Warlords".
Later, they made it for their game machine, the 2600.
Does anyone know if this game ever made it to the 8 bit Atari's, or any
other machine, for that matter?

Atari printers used a custom 13-pin serial interface.
Somewhere in the back of my closet is an old MPP interface which
allows you to use and standard Centronics parallel printer.
Interested? I can dig it out.

1711. Atari - Mac - GCR Spectre

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-27 02:25:11 UTC
From: ab588@yfn.ysu.edu
Message-ID: <1u18q7$pad@news.ysu.edu>
Source record: 106767

From: jpost@zeus.datasrv.co.il (Jerusalem Post)
Subject: Atari - Mac - GCR Spectre

I have an Atari STFM 1040 with double disk drive and a Macintosh Plus 2MB with a 40 MB Hard disk. I often use the Mac Plus for DTP use, running Pagemaker 3 and 4. I have Spectre GCR, and often use the Atari for emulation purposes, moving data and application files from the Atari to the Mac and vice versa, using Maclink on both machines. My objective is to use Pagemaker 3 on the Atari, however due to its sheer size, 870 mb, it won't fit onto a Spectre disk. My conclusion is that the program can therefore only be run properly from a hard disk (as is the case with the Mac). I have tried unsuccesfully to run Appleshare and TOPS software in emulation mode between the two machines - the problem I imagine is that the Atari is unable to run Appletalk. With the ST looking like it is coming towards its lifespan, I am not prepared to buy a dedicated Hard drive as the prices here in Israel for the Atari are exceptionally high. Is there any way with my present set up I can access the Mac's hardisk from the Atari in Spectre emulation mode and so access applications stored there? If so what will I require? (I have heard that in the UK they are now marketing a product called the Link). Will I be able to create Spectre and separate Macintosh partitions on the Mac hard drive? Will data files created onto such a partioned hard disk be moveable from the Spectre mode to the Mac mode and vice versa? If no one out there is a GCR freak, please help me get in touch with people who may have the expertise. Thanks, Derek Fattal

From: Jeff_Mcwilliams@abcd.houghton.mi.us
Message-ID: <Jeff_Mcwilliams.0h22@abcd.houghton.mi.us>
Source record: 106788

Steve,

The Fastest Static RAM that I've seen is 32Kx8 COMS Fast SRAMS
in a thin package, running at 12ns. JDR Microdevices sells them for
$20.00 per chip. Pretty nasty. According to Western Design Center,
something like a 65C02, or even a 65C802 has a maximum clock speed of
10mHz. I think they have one faster 65816, running at 14mHz, which
is a developer chip. It requires like 5.4 volts or something like that.
Assuming 10 mHz, one cycle is 100ns. THe 6502 series access RAM in
half a cycle, requiring a RAM speed of 50ns. The processor needs would
easily be met by the 20 ns SRAM chips which sell in the JDR catalog for
$13.00 each. Western Design also sell several other chips which
may be useful for the would-be accelerator engineer.

W65C22S Versatile Interface Adaptor. Similar to the PIA in our 8 bits,
it has two bidirectional 8 bit I/O ports, two 16-bit
interval timer/counters with latches, and a serial-to-parallel
and a parallel-to-serial shift register, for
shifting data in/out of CB1 and CB2.

W65C29 a super simplified PIA, simply provides 8 bits of
input/output. Has a data direction register, but no latching
or strobe lines.

W65C90 8 bit comparator, you write to a register the 8 bit value to
be looked for. When a match is found on the inputs,
the Equal line becomes active.

The above are available in speeds up to 8mHz, not sure if 10mHz versions
are available.

So, yes, I suppose such a hardware modification as Steve proposes
is feasable. Some flaws in Steve's approach.

He proposes a special hardware register be written to enable/disable
high speed, through the use of a divide by N counter chip.
Well, even with this, only custom software would run at fast speed.
It's quite obvious that the 8 bit community's programming resources
are few. There isn't exactly a storm of new software products being
developed these days. So as with Dataque's Turbo-816, I suspect
an accelerator of this implementation would be a failure due to
lack of software to take advantage of it.

What would be more feasible is this:

design a high speed PAL or GAL chip that watches the address bus.
When the CPU goes to address the hardware area, (PIA, POKEY, GTIA, ANTIC)

or the OS ROM area, or the Parallel BUS Interface area, the GAL chip would be programmed to automatically switch the clock, via the divide by n circuit, to the standard frequency. When the CPU addresses the fast 64K of SRAM, the GAL switches the clock to the higher speed. Somehow the GAL would also have to be able to watch for Antic DMA access, and automatically slow the clock when this happens. Since Antic DMA, according to many programming and hardware sources, accounts for at least 30% of the CPU time, I expect Antic DMA to severely limit the performance boost of such a proposed accelerator card.
The solution? Use an XEP80? Well, if my knowledge of the XEP80 is correct, the XEP80 driver on the computer uses a POKEY timer or something as a clock synchronization signal to be sure serial data sent/received from the XEP80 is done correctly. Can't seem to find my 800Xl schematics, but POKEY timer interrrupts are based on the CPU clock frequency yes? Which brings up another problem. Sound generation would be screwed up also if using the 1.79mHz clock. I'm not sure how the 64Khz and 15Khz clocks are derived on the motherboard. Okay, I guess if we just continually feed 1.79mHz to that chip things might be okay.

Other problems.

WDC requires minimum orders of $100.00 for their chips. Not a big thing. If you're serious about this, $100.00 is gonna be nothing compared to the equipment you're gonna need to develop and debug the hardware.

GALS - these are basically programmable logic chips. A GAL programmer will cost you at least $700.00 and requires a PC. The chips themselves, depending on how many inputs and outputs you require, run from $3.00 to $100.00 (that's a fancy GAL with 68 pins!!!)

It's doable, I agree. But a production model will still cost at least a couple hundred bucks. I'd buy 2 of 'em.

Jeff

1716. Re: clock speed

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-27 09:19:19 UTC
From: Jeff_Mcwilliams@abcd.houghton.mi.us
Message-ID: <Jeff_Mcwilliams.0h2f@abcd.houghton.mi.us>
Source record: 106789

Another thing I thought of that would be a problem. Expanded RAM.
On a 64k machine you could just totally disable the regular of 64K
and always use your high speed 64K of CMOS SRAM. But at $12.00 per
32K, 256K is gonna be about $100.00, and the prices get astronomical
from there on up. So, perhaps additional programming in the GAL
chip would be required to watch Port B, and if banking is activated,
and the CPU/Antic is addressing $4000-$7FFF, bring the DRAMS back online,
slow the clock speed, let the banked RAM be accessed, and then
shut down access to the DRAMS, accelerate the clock again when you're
back to addressing the standard 64K of high speed SRAM.

Another thing, that GAL is gonna have to be awfully fast.
Let's assume this is a 10mHz accelerator. In the period of 50ns,
the GAL will have to look at the address, determine which speed
is required and switch to that speed, allowing for switching delays
in the divide by n LOGIC gate and any additional TTL gate circuitry,
and still leave enough time for the RAM to respond properly before the
cycle ends. When switching from 10mHz to 1.79mHz things shouldn't
be so bad, because you suddently have more than 200ns before
the cycle ends. Staying at the same speed won't be a problem either,
since the latched output of the GAL will remain the same.
It's when going from 1.79 to 10mHz that problems would arrise.
Perhaps RDY could be pulled low to stretch the clock for that
switching cycle, to give everything a chance to stabilize.

quest@iowegia.dsm.ia.us (Steve J. Quest) writes:

Except that, to run anything near that fast, you'd have to replace the page zero ram with fast static ram (add 56-90 pins worth of decoder/static rams to the 14 or so for the '190). You'd also have to use quick DRAM for the rest of the memory map. Bob Wooley did that with a 1 meg 70 nsec simm on a 1200xl, but that's another 100 or so connections. I'm not saying it isn't do able, it's just that for the average human it's an huge task. I doubt if anybody short of an experienced engineer could accomplish it. For that many pins it would take a circuit board which unless I'm wrong, minimum runs/single prototype are about $500 right?

Ben,

No, actually if you saw the public post I made on the
subject, it doesn't appear all that difficult to either
Master/Slave process the Atari (many computer designers use this
approach to increase speed without altering hardware drastically)
or put in tri-state buffering to kick the custom devices off the
bus, go to "hyperspace" and back- all in less than a jiffy so the
operator didn't even know it happened. In theory, there is NO
LIMIT to the speed jumps, so long as clone 6502 processors are
available at those speeds (and you upgrade the ram to handle the
access time reduction).............sq

1721. Why complain about clock speed???

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-27 17:31:47 UTC
From: G44@delphi.com
Message-ID: <01GYO6V5C30I8ZFV32@delphi.com>
Source record: 106776

Yes, this accellerator idea will never die, why? Because other machines, the Apple IIGS, etc..
all seem to be able to use faster CPUs. I like the DSP idea a lot, as well as Jeff's separate 68001 coprocessor idea, but essentially
what it amounts to to actually get a faithful CPU upgrade is redesigning the whole motherboard into a kind of
AMIGA, and then it wouldn't be the ATARI any more, certainly wouldn't run too many well-timed programs.

Sure, it sounds good on paper to up the clock speed, but you gotta ask yourself, what is it going to run? We have a hard time as it is getting
software written for what we've got! Banked ram has been with us for 8 years and the number of programs that utilize it are so few it is a
disgrace! What good is an 50mhz ATARI with nothing to run on it, or with the 64K barrier still firmly entrenched?

I would argue that in terms of increasing the 8-bit's usefulness, working within the machine's archetecture is better than forcing
it into different directions. 1-4 meg ANTIC-banking upgrades and productivity software that smoothly uses it, hard drives and other slaved
IBM peripherals through the ATARI's most versatile PBI, CART, RS232>SIO, or game ports, and maybe sometime down the road a co-processor with
FLOATING POINT OS hooks so that it would run with a great deal of existing software, this is the best way to go in my opinion.

You guys wouldn't still be using the 8-bit if you thought it wasn't pulling its own weight as it is, and for the majority of tasks, its clock
speed is adequate. For those few demanding tasks the above modifications should be able to increase the throughput and capacity
enough to please most people.

I was amazed when I first booted TurboBasic, everyone is aware of how slow ATARIBASIC is, the ability of TurboBasic (or Basic XL/XE) to go
many times faster, as an interpreter language, is quite remarkable. I sometimes use slow programs like CREATE-A-FONT, and they become
medium-speed programs with TBXL, let alone what they'd be if compiled! Aside from the FEW productivity programs at the very high end of
ATARI limits, I don't see any reason crying over the inability to accelerate the machine. You will all still be able to use your hard
drives, banked ram Paperclip and what not, which is what makes the ATARI more powerful than most any other stock 8-bit machine.

Now if someone could finally figure out what MicroMiser is doing with TurboFile/Base??? Maybe Ben P. could elaborate on it for us, cuz it
seems to be the most powerful spreadsheet/database package for TODAY's hardware mods, although

DiskBase, though written a LONG time ago, manages to do some similar things.

SOMEONE DO thIS! ;) Hehehehhe... damn, imagine what rendering I could
do with 3d stuff (gasp)

I mean, so far, resizing an image in turboBASIC using LOCAtE >IS< a bit
inefficient, but doing the same style thing but using bitwise operators
and Action! or C or Assembly would STILL be a bit slow for my taste..

you should see AutoDesk's Animator on my school's 486's!

Alright, who out here in the cyberspace of Atari Classic computers are...

FAMOUS!

I don't mean the famous like Robert Puff, Bob Woolley, Jeff Potter, I
won't go on ;) .. (Puff=CSS/MyDOS/BobTerm.. need I go on?
Woolley=1200XL hacks, ...gave me Action! and a new 1200xl tho too hehe,
Potter=APAC/ColrView ... I love graphics)

anyways... I mean the famous like, oh, movie stars, governors, etc.etc.
famous OUT of the computer community...

just curious

thanx ;) what the heck, why not a well compiled list of
the Atari classic gods as well? ;) ;) ;)
(Add me in for most annoying heheheh)

I have the following Atari 8-bit items for sale:

Hardware - 1020 color pen plotter/printer $10

Accessories - 1 Epyx 500xj joystick $3
1 Archer (Radio Shack) joystick $3
1 Suncom Tac-3 joystick $3
1 WICO BOSS joystick $3
1 Atari 7800 joystick $3
1 set of paddles $5

Software on disk - Bank Street Music Writer $5
The Converter version 1.51 $5
Print Power $10
The Print Shop $15
RAMbrandt version 2.0 $10

Games on disk - Alternate Reality - The City $10
Alternate Reality - The Dungeon $10
Boulderdash Construction Set $10
Chessmaster 2000 $10
David's Midnight Magic $5
F-15 Strike Eagle $7
Hacker $7
Jawbreaker $5
Jewels of Darkness $5
Leaderboard Dual Pack $10
Master of the Lamps $7
MRCA Mach 2 $5
Pinball Construction Set $10
Quest of the Space Beagle (no docs) $3
Silicon Dreams $5
Trail Blazer $10

Books - Basic Atari BASIC $7
Mapping the Atari, revised version (includes XL stuff) $10
Atari DOS 2.5 Manual, $7

Magazines - ANALOG Computing issues 44(7/86), 45(8/86), 46(9/86), 49(12/86)
Antic: July, Aug/1985
Dec*/1987
Apr, Dec*/1988
* these issues include the disk

I also have over 50 ds/dd SpartaDOS formatted disks with
shareware/public domain/magazine software on them...

If you are interested in any of the above please contact me...

>
>It has a port on the back labeled SLAVE DRIVE, I'd like to add
>another DS/DD drive to my system or if possible with the TRAK
>to add a 3.5" floppy.....
>

I have a couple of TRAK drives, one I bought new in ~84 and one I
bought "smoked" for pocket change. The drive controller is basically
the same on all TRAK drives, but the code in the EPROMS probably
varies widely. Are you sure the one you have is DS/DD and not SS/DD?
Both of mine are SS/DD, and as I recall TRAK went under right about
the time they released DS/DD.

Yep, 100% positive, it configures itself as D1: (side 1) and D2: (side 2)

For those of you that were interested in the outcome of this question:

I found out from someone that the TRAK drive can take another drive (just
a straight 360k IBM/PC floppy) via a 34 pin cable.. The drive needs to be
configured for drive 2... Also the TRAK powersupply can not handle another
disk so another case is needed to power the drive (wouldn't fit inside anyway)

Hope this helps people...

From: aj227@yfn.ysu.edu
Message-ID: <1u3v1r$qa5@news.ysu.edu>
Source record: 106786

Hello again,

I am looking for some info on IBM kermit programs. I wanted to ask
about it here first since it relates to the 8-bit Kermit program. I have been
ablto download software from the ATARI ARCHIVES using one of the version
of Kert. TO wnload, I have to access a Gopher Server, FTP to the archives and finally get
to the directory/ files I need. The settings on kermit have to be: parity even, file-type
binary, word size seven, and eig-bit-quoting on.
I have tried to download the same way on a PCusing MS-Kermit but I have
been unsuccessful since there is no eight-bit-quoting. AT esent, this method along with the
BART mailer are the two methods of receiving les
I have available. I should say again that I have been successful downloading
thru a gopher server using the 8-bit kermit programs buecause of the fact they allow
this eight-bit-quoting. What is eight-bit-quoting anyway? I have not gotten
any real answers when I asked people strickly in the PC world.

Any help would greatly be appreciated.

Rick,

Such a task IS doable, but probably limited to serious
"engineer-like" people. I would use soic (Small Outline
Integrated Circuits) chips, but would mount them to soic2dip
adapters to make my task of prototyping easier.

If someone was to pay me rate to do this job, I would
enjoy the challenge- I also think I could pull it off, especially
the "tri-state the customs and kick the cpu to hyperspace"
technique I discussed.

You don't need to use sram (static ram) in the page zero
region, for all the clone 6502 cpu's I have seen, standard soic
ram chips could be implemented- or even fast dip 41 series ram!

I wish it took less than hard cash to motivate me to
prototype anymore. I have been an engineer for so many years I
still have the want, but not the drive. Money seems to be my
motivating factor anymore. I can't even motivate myself to dig my
old 800 out of the box.....sq

1735. Digi-Studio -- new price info and info sheet

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-28 09:22:45 UTC
From: djg0@aber.ac.uk
Message-ID: <1993May28.092245.17593@aber.ac.uk>
Source record: 106557

As you may know, I am the programmer and developer of Digi-Studio -- the digitized sounds and music utility.

At the start of this year I managed to get a distributor in the US, and thus make it easily available. However, the price has had to remain high to cover initial costs. Unfortunately, we have had no luck at all in selling copies in the US. We believe this is because of the high price.

To show that we are not just in this for the money, and to show our commitment to producing new software for the Atari 8-bit community, we have decided to take vertually no royalties on Digi-Studio, and as such we have managed to lower the price down to just $15, including shipping.

This price will get you the 44 page manual and 2 SD/DS disks. You get all the usual programs included: tune player, keyboard player, sample editor, tune to Basic compiler, and the LIDS language compiler v1.2.

Digi-Studio is available for sale now in the US, and the UK. You can buy it direct in the US. See the info attached to this article. In the UK Digi-Studio costs 7pounds, including P&P. To EEC countries the price is 10pounds including Air Mail. Pay using pounds in cash, or by IMO.

Dean Garraghty. Email: djg0@aber.ac.uk.

Digi-Studio Information

Digi-Studio is a set of programs for the 8-bit Atari (XL/XE) for creating music using "real" sounds, which have been digitized. The Digi-Studio package contains everything you will need to create and play music using digitized sounds. Here's a list of the programs included:

* Keyboard Player. Allows you to play music live by using the computer's keyboard like a piano keyboard. The sounds produced are, of course, digitized. This program has fully responsive keys, so that sounds only play for as long as you hold the key down.

* Tune Player. This program plays Digi-Studio tune files using digitized sounds.

* Sample Editor. This program allows you to edit sound samples by using a joystick. It also has "cut and paste" facilities, so you can also create your own samples.

* Tune Compiler. This program allows you to play Digi-Studio tune files in your own Basic or Turbo-Basic programs.

* LIDS Compiler. This program allows you to create your own Digi-Studio tune files by use of a language called LIDS.

Also included are 55 sound samples, and 47 ready-to-play Digi-Studio tune files.

The Digi-Studio system comes on 2 DS/SD disks. Disk one contains the main programs and a starter pack of sounds and tunes. Disk two contains more samples and sounds for use with Digi-Studio.

The Digi-Studio system is also supplied with a 44 page manual in A4 size(UK), and standard letter size in the US. This manual has sections describing all the programs listed, but also has a lengthy section on how to read music. An appendix has also been added containing music along with the corresponding LIDS programs.

The Digi-Studio system (with manual and 2 disks) costs just 7pounds, including P&P. In the US it costs $15, including shipping.

Fill in the form below and send it with payment today!

------CUT------
Please send me a copy of the Digi-Studio system, with manual and 2 disks.

The times I've received split files, all I have done was to append them
on the host machine and then enter the host machine's editor and delete
the garbage lines between the parts. When I download to the Atari,
it appears as just one big file and uudecodes and unARCs just fine.

1739. Classics Disks

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-28 16:19:19 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9305281536.AA19513@smithkline.com>
Source record: 106798

The Software Disk published concurrent with every other issue of Atari Classics Magazine is NOT Public Domain!

If anyone has posted the Classics Disk to the Archive, I respectfully request that it be removed IMMEDIATELY!

If the Classics Disk has been posted to any other BBS or telecom system, I would to ask those sysops to remove it.

The AC Disk comes out 3 times per year. The subscription to it only costs $9 (that's $3/disk, the going price for a PD disk from a PD distributor).

After some period of time has passed, we may consider releasing out disks to the public domain, especially since many of the individual files on them are already PD.

I again remind everyone that AC is as yet UNDERSUBSCRIBED. The main reason we continue to exist is that disk sales have our exceeded our expectations, & the excess revenue from disk sales is making up the loss in renenue we are experiencing due to the fact that only about 35% of the people in last year's mail campaign followed through on their subscription pledges.

We have kept the price of our disk as low & reasonable as possible. My god, if people want to copy a $3 disk, then there is just no hope at all for the future of our market & for us as a community of users.

I can't even begin to entertain the idea of allowing our disk to be posted until the magazine is fully supported. To be sure, we're getting close. AC needs 500 paid subscribers to break even on expenses, as of today we have 478. But new subscriptions have pretty well come to a standstill.

I'm still waging a battle just to get us a 2nd Class mailing permit. Last week I once again hit up on Unicorn Publications to allow us to apply for the permit. But without 500 paid subs Unicorn is playiong hardball & steadfastly refuses to let us upgrade the mail service due to the expense of the permit. BuT I keep trying, I'm keeping up the pressure on them, maybe I'll catch them in a weak moment & they'll give in. :)

AC is a 2-way street. I'm willing to go to bat for the user community, fight the battles that need to be fought. But the user community has to be solidly behind the AC Staff or the whole thing will fall apart. The something-for-nothing mentality has already gutted the AC effort, leaving it just on the verge of survival.

There are no magic geese, & there no golden eggs. There's just us. We ourselves are now the Bottom Line, & if we do not soon start paying our bills & thinking in terms of what's best for the community instead of "How

can I get something for free?", then you can just kiss it all good-bye.

1740. Re: Why complain about clock speed???

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-28 16:24:03 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <s3P04B1w165w@cyberden.sf.ca.us>
Source record: 106799

True, Glenn.. not many people would particularly NEED a faster machine,
but some of us wouldn't mind programs like Fractasia, APACView, etc.etc.,
which take forever, to run quite a bit faster.

I feel it's something like this:

you could somehow have a SWITCHABLE OS: 800XL OS & "Hyperspeed OS" or
whatever...

then, when running things like Star Raiders, some font editor, most
games, etc., you'd have it in 800XL mode

when running APACView, Fractasia, heck, even TextPro gets too damned slow
for me when I have a huge document in it, and perhaps some math intensive
(altho I see where a faster FP Package might be enough here) like the
Optics rendering my Animation program does, you'd switch to "Hyperspeed"
mode, where all the rendering, memory block moves, mathematical
calculations, etc., are done while you wait.

"While you WAIT"... these days I'd rather not WAIT as long.
Even with a hefty 192k (altho I'll take a 1 meg upgrade + Hard Drive ANY
day ;^)), which speeds up disk transfer, I'd like something that
CALCULATES faster.

Ah, another example: Daisy Dot III... even when "printing" to RAMdisk,
it can still take quite a while to do something that I see the IBMs (like
comparing apples to oranges...eww, no wait... Ataris to IBMs ;^))
do in a few SECONDS... sure, my XMM801 aint FAST, but...since I have a
PAIR of 1200xl's, I could use the old one, stealing a drive, to [C]opy
MYLETTER.PRT -> P:rinter and go on doing other stuff (preparing another
DD3 .PRT file) on the FAST system. (BTW: 1/2 the reason I copy DD3 files
to disk to be printed is because my 1200xl with the 192k, etc., etc.
doesn't talk to the printer any more.. I killed the SIO! >:^(At least
it still works with the drives! <whew!>)

Anyways... I see PLENTY of applications! You just gotta LOOK!

Sure, not everyone will NEED or have the $$$ to BUY such an upgrade...
but not everyone NEEDS a RAMDisk.. I'd DIE without one tho!

Anyways.. again, my examples of what can go HELLA fast, and make >MY<
life more productive are:

Daisy Dot III
TextPro or AtariWriter + (ie, inserting at the beginning of a big
file)
Animation programs (2d & 3d rendering)

Fractasia
APACView
ColorViewSquash and ColorSquashView
ChromaCAD XE

and on and on and on

I mean, Glenn, we could argue the use of a color screen! (<cough>, Macs)

If you want UNIVERSAL COMPATABILITY, there are more than a
FEW flaws to my approach. I suppose if I were to do said, I would
wedge into programs the toggle at key spots- tho I really can't
think of ANY program for the Atari 8-bits that really require the
horsepower. Most programs that felt slow to me were slow due to
disk access, not processing speed. Our project may be moot!

> Somehow the GAL would also have to be able to watch for Antic DMA

I did forget about an important factor earlier, your
mentioning SRAM triggered it. I personally would use the CHEAPER
DRAM and have lots of ramdrive space left over for the same money-
but the problem arises of ram refresh. A separate refresh circuit
would have to be built- no big deal, minor problem. Currently
DRAM refresh cycles are taken care of automatically by the ANTIC,
one of its jobs. SRAM does not require refresh- so even at 4
times the price or more of DRAM, it might be worth using it.

I still like the user selectable "memory location toggle"
for "hyperspace". That way you could use it only when you needed
it- but like I said previous, I really can't think of a time when
I needed faster CPU speeds. The slowness of the Atari is wholely
attributable to the slow serial access floppies.....sq

(again, the whole project may just be moot....)

1743. 3.5" Drives

Just thought I'd forward this com from Andrew Diller along to the newsgroup, apparently you can indeed replace those ancient full-ht. mechs in Percoms with other sizes of IBM-type drives:

From: INET::"dillera@wam.umd.edu" 26-MAY-1993 23:58:02.51
To: phvax::poehland
CC:
Subj: Re: 3.5" Drives

In article <9305241833.AA12266@smithkline.com> you write:
>
>There is supposedly another way of connecting up 3.5" QD floppies, I've never
>tried it. A few people have reported that you can replace the 5.25" mech in
>later-model Percom DS/DD drives with the std. 3.5" mechs & they will work

fine. I was luck enough to get my hands on a Percom- it had a double height double denisity, single sided drive. You just need to rip that out and you can install up to 4 ibm/pc drives- 3.5 or 5.25. It works great with MYDOS.

1745. 800xl power supply?

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-28 22:59:12 UTC
From: grover@emunix.emich.edu
Message-ID: <1u65g0$pjn@zip.eecs.umich.edu>
Source record: 106804

Hello Atari fans! After reviving my interest in 2600/7800 games, today
I got a terrific deal on an Atari 800XL computer for $5, and a 1030 modem
for $4. Now I think I know why...

The 800XL seems to have a strange, round power input jack (7-pins)
labelled "DC". This is very different from my original 800 computer.
Where can I get the proper power cord?

(This obviously opens an invitation for anyone willing to sell me an extra
one.)

Source record: 106706

I'd like to mesh together what Glenn, Bill, and Rick have recently said.

First Glenn's excellent points made about why bother worrying about
acceleration. True, most people who are in the 8 bits today are in it
because they're willing to deal with the limitations inherant in the
system. But to make a point, I'd like to carry that idea to an extreme:
why do we bother adding more memory, or using anything beyond a stock
XF551 for storage? It seems that if you're using your 8 bit today, you're
doing so because you're willing to deal with its internal limitations.
Well, for the same reasons that we add 256K, 320K, 576k, and ack! 1088K,
and Black Boxes with hard drives and stuff, that same line of reasoning
can apply to an accelerator. It's job is to boost productivity.
I have to agree with Bill, programs like Daisy Dot III, Jeff Potter's
GIF decoding programs, word processors with BIG documents, all such
processor speed. I think that there are at least a good handful of
us who, while happy with the CPU the way it is, would like to see it
run faster if that becomes possible without sacrificing compatibility.

On the other hand, Rick Cortese's points need to be considered as well.
A production run of accelerator cards would require

A) a significant amount of capital up front, and would end up
with a rather expensive card

B) a sizeable quantity of people willing to open their wallets and
actually purchase the darn thing.

My gut feeling tells me at least one of the two criteria above will
fail to be met. So what are we left with? Well, the only thing left
to hope for is that a small concentrated group of people successfully
design the thing, it becomes a public domain hack, and a few gifted
people hand build the accelerator, cash up front, to the few high
end users who are actually interested in, and financially capable
of purching it. A hand built card is gonna look terrible, and yes,
it does symbolize our deteriorating marketplace, but what else is there?

1748. Announcement of Killer 'thello release

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-29 02:03:13 UTC
From: mark@godzilla.quotron.com
Message-ID: <C7rn1D.KyD@quotron.com>
Source record: 106713

I've just uploaded Killer 'thello to atari.archive.umich.edu (141.211.165.41) under the filename THELLO.ARC. The archive is 41926 bytes long and contains the executable, documentation, and full MAC/65 assembly source. Pending some administrative delays, it should be in the 8bit directory shortly.

Killer 'thello is a computer adaptation of the classic board game Othello (also known as Reversi) with the modification that players don't have to take turns. You can play against another person, the computer opponent, or both at the same time. Killer 'thello was sort-of inspired by Killer Chess written by my pal Greg "maddog" Knauss.

If there's interest, I could also upload a VERY complete Font/Character Set editor I wrote over the period from 1985 to 1989. Too many features to mention. Let me just say that it has everything I ever heard of or saw in another editor. It was used to create both the character sets and screens in Boulder Bombers, Maze War, Killer 'thello, and a few projects that never saw the light of day.

1751. The Turbo Atari 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-29 07:19:46 UTC
From: theclub!conklin@egr.msu.edu
Message-ID: <9305290703.AA19969@theclub.UUCP>
Source record: 106709

[I already posted this once, but it was some bizarre earlier version. If you saw another posting cut strangely short, here it is for real.]

I want to post this because I see discussion again coming around to the popular Turbo Atari 8-bit, in the sense of increasing the clock speed. This is a project I'm very familiar with because I put some effort into it. I have a TRS-80 Model 1 pushed to 300% of design speed, and killed some time with a scope in pursuit of this idea on the Atari.

This is an engineers article. I.e. if you primarily work in BASIC, it's probably way out there. I want to post specifics because I got very close, but haven't had time to continue. Specifically, when another major 8-bit fan and generally bright boy _Ken Sumrall_ and I got to working on it together we got as far as the following. I'm going to write this as an article for publication, with the idea that if this design information is disseminated widely enough, perhaps someone else will have what he needs to finish.

-=-

A popular dream amongst Atari 8-bitters is the idea of a speed-up mod. The purpose of a speed-up mod is, quite simply, to increase the CPU clock rate and thus boost performance. IBM compatibles are commonly identified by MHZ, with given machines like a 386 available at 20 or 40 Mhz. IBM compatibles, and TRS-80s before them, get a more or less linear speed increase. I.E. double the clock is twice speed. A powerful punch for an Atari which already sports co-processors.

Designing the turbo mod, however, involves a number of hurdles. In fact, it's akin to an Olympic Grand Prix, where the horses face impossibly high obstacles and even one mistake means failure. Here are the obstacles we found, and the answers to them, in the order they were encountered:

High speed 6502 processors

On the Atari, until a few years back, 6502 processors were not available in higher speeds. The Atari 6502, running at 1.7+ Mhz, is actually pretty quick for a 6502, which gets a lot of milage out of a given clock cycle much like RISC processors. The 'obvious' speed increase, 100% (a jump to 3.5+ Mhz) requires a 4 Mhz rated 6502. This is now available. Initially from Western Design in the form of the 65C02.

But is it a 6502?

The Atari XL & XE, however, don't use a 6502. They use a custom version of the 6502. Because on the Atari the 6502 processor has to share memory with Antic, (which accesses memory on its own to update the screen,) it has to be able to come 'off the bus,' or 'tri-state,' while Antic does its job. On the

original 400/800 design, a series of tri-state buffers surround the 6502 and do the job of 'detaching' the 6502. To lower the chip count on the XL & XE lines, Atari developed a custom version of the 6502 which had the simple tri-state buffers built-in. Thus, any processor upgrade for the XL/XE lines would have to replace these buffers since the only high speed 6502s are real 6502s and not Atari's custom version. My guess is the Turbo/816 mod has these buffers on it.

Memory chips

Many Atari's are still using original RAM chips which are too slow to handle the CPU's requests at higher speeds. Fortunately, memory upgrades are based on 256K DRAM's and they're almost always fast enough. Now, higher speeds are trivial.

ROMs

The Atari ROMs weren't particularly slow, but may, depending on the speed-up attempted, need to be replaced with faster current technology EPROMs.

What to speed up?

The Atari custom chipset is, necessarily, old. Those chips aren't likely to survive any speed-up attempt. Further, the 1.7+ Mhz clock rate of the Atari is tied to the NTSC Television rate. Antic & GTIA need that rate in order to work with the television set. Our design opted to simply speed up the 6502 and let the rest of the system continue to operate as before.

What about games?

My theory is games should work OK. Most games timed themselves off of VBLANK or the timer, which are external to the 6502 clock rate.

How can you speed up just the CPU?

Surprisingly to most people, in the Atari the 6502 doesn't run the show. Antic does. Antic, when it needs access to memory, just reaches over and shuts down the 6502. Thus, Antic could care less what speed the 6502 runs when it's not involved.

6502 vs 65C02 timings

Now some real problems: the Western Design 65C02 was the first available 6502 that could actually handle 4 Mhz. However, beyond the relatively simple missing buffers, Ken pointed out a fundamental difference: The 65C02 is _edge_ triggered, the 6502 is _level_ triggered. That is, the 6502 considers an 'on' signal to be when the level reaches 5 volts, where the 65C02 considers 'on' to be when the voltage changes.

This is bad. Antic sends a 'halt' signal which shuts down the 6502 while it accesses memory. This signal hits in time for the 6502, but a Western Design chip sees the signal level come up _after_ it's started into it's next cycle. It may arrive in time in a normal speed environment, but at double speed, the 65C02 will be already chugging along and not stop in time.

An alternate halt signal

The next thought was then "what about an earlier halt signal?" Ken stared at the schematics and found that, by combining some signals 'upstream' of Antic, we could re-create the halt signal. We then attached a dual-trace scope to the 6502 halt line and the critical signal, and found that the new signal in fact does hit before Antic's halt. Approximately 10 ns in advance.

Unfortunately, this signal alone is not enough. The combination of it and one or two other signals is needed to recreate 'halt'. A circuit to decode this signal involves three levels of logic. Given our extremely tight 10 ns window (est. from a scope display) we figured that using 74 S-series logic, which has a nominal gate delay of 3 ns, it would just fit. At this point, life kicked in and we did not build a prototype to test it out. My apologies for not having more specific information - this is from memory of work done 4 or 5 years ago.

Post-mortem considerations

Since we embarked on this effort, a couple of new things have come along. First off, we now have new logic devices available, including the 74HCT family, which is supposedly pretty quick. Another option are the now widely available high speed programmable gate arrays and other field programmable logic, which may or may not be fast enough.

Also, in the years inbetween 6502's have progressed. At one point, I saw a reference to a real Rockwell 6502 rated at 4 Mhz. This, should it be a high speed version of the original design, would eliminate much of the hoop-jumping involved with Western Design's chips. 'Sally's' tri-state buffers would of course still need to be replicated.

This is exactly the kind of project that, given this info, would be trivial for a hardware designer. Perhaps you know one? For anyone interested in this project, I will coordinate efforts on The Club's ATARI conference. An extensive library of memory-upgrade docs, software and testing tools is also available on The Club II.

All in all, this is an interesting project because the solution involves technology released as much as 15 years after the 8-bit's original design. Realistically, with today's technology one could reasonably implement an entire Atari-8-bit-compatible motherboard on a single field-programmable gate array, let alone ASIC; transistor counts in 1978 were nothing. It is a fitting tribute to the 8-bit's clean design that it could continue to thrive well into a time where it could fit in a wristwatch.

But see, you're missing the point. Ask not if the AC disk is PD, but how I can subscribe to the A.C. disk. Gee, what a concept, actually subscribing to the disk. $9.00 measley bucks, for 3 disks full of goodies. I'm afraid I have to share Ben's pessimism toward the 8 bit community when such posts appear on C.S.A.8. It symbolizes the fact that the 8 bit attitude hasn't changed, despite Atari officially dumping us, despite folks like ICD no longer producing their products, despite Innovative Concepts, who used to carry an excellent selection of memory upgrades, having shut down their operation. It's the something-for-nothing attitude that's killing us folks. Witness how many 8 bitters failed to live up to their campaign promise of subscribing to the magazine. As for the disk, even the disk wouldn't be a reality without the decent folks who are running the disk operation for FREE. Then there's people like Steve Quest who says he'd work an accelerator if we paid him to do it. Gee, whatever happened to folks like Claus Bucholz, who accomplished the ground breaking miracle of adding 256K to an 800XL? He did it for free!

I guess it's no wonder people aren't developing applications anymore. If folks don't want to shell out 9 bucks for 3 disks full of goodies, why should a programmer think his application will meet with financial success?

From: jbmorris@bronze.ucs.indiana.edu
Message-ID: <C7snx6.FEA@usenet.ucs.indiana.edu>
Source record: 106715

Well, I have gotten someone to loan me his XM301 Atari modem and XE-Term software. I am using an Atari 800XL 64K with 1050 standard disk drive. The program was DOS 2.5, but I converted it to DOS 3.0. Neither way quite works, though. I am connecting to the Unix system fine, but file transfer isn't working.
I CAN do cat> and then do 'U' on XE-Term to upload text, and then it will just spit it to stdin. But send and receive XModem aren't working. I'd like to be able to download some of the files at the archive.
I'm using rx filename and sx filename, or sx -b filename on the files from the archive. I can't seem to figure out any other switches that seem appropriate for the command.

Anyone happen to know what I'm doing wrong?

In a related question, is it possible to directly connect one of the Atari ports to my serial or parallel on IBM and transfer that way? I do NOT have an 850 interface, just this XM301 modem.

Any help is appreciated.

Thanks,
Jeff

I bought an XF551 Disk drive from a friend, but the mechanism wasn't working, it wouldn't even begin to read. He used to have to Hit it to get it to work. I swapped mechanism's with a friend and so I know for sure it is the mech. Anyone know would this be some kinda Misalignment problem?

Also, I hooked up 2 different 360K mechs to the controller, and they worked perfectly, Reading and Writing, but neither will FORMAT, in any Density, or option on SpartaDos... Anyone know why there is a problem with Formatting? Any Ideas?

> Can anybody tell me how I am supposed to recombine these separate parts?
>I have tried uudecodeing them separately but that gives me two separate
>files! I am using a VAX/VMS, so any help would be appreciated.

By now you've learned that the way to do it is to append all the parts
together and delete all intervening junk text to make one big file.

What I want to know is, what uudecoder DOES know how to properly put
together the multiple-part uuencoded files BART sends? At the bottom of
each part is an "include" line that looks like it tells the decoder where
to look for the next part of the file, and so on. And line part is given a
different intermediate filename as well.

On every system I've tried it, the only way to decode the files is to
delete all these fancy file-part indicators from each part, but somewhere
on some kind of system there must be a uudecoder that makes use of them,
right?

Actually, although I don't really endorse the idea because of the cost
would be more then most people would invest, I did do some serious
thinking about it & the ability to decode stuff *isn't* that bad IMO.
Figure you only need to monitor two lines (@ least in the XL 6502C). The
!HALT line of the CPU at PIN & maybe the MMU !IO lline on pin 17. The
!HALT line stops the CPU when one of the other chips needs access & the
!IO is true for any access to the $D000 to $D7FF or hardware. Whoops! PIN
35 I think for the !HALT ^
You could do that with one or 2 $.20 IC's. Still, The cutting traces for
the CPU to run at a multiple of the clock speed while the rest of the
chips do their stock 1.79'r is iffy at best (IMHO).

An Atari 800 even played a prominent role in one of his short stories,
which surprisingly has just been reworked into a novel and is available
in hardcover (_Lost Boy_, copyright 1993). Good short story, but I haven't
read the novel.

Also chalk Mr. Card up as a famous C-64 owner. He used to write a
column for _Ahoy_, a Commodore magazine.

Jeff,

Please don't shoot flaming firballs at me for this, but...
Why would you want to view GIFs on an Atari? Straight VGA is very
cheap today, and is MANY TIMES BETTER resolution than GTIA.

I don't even remotely consider the Atari to be a graphics
machine anymore. At one time, it was the BEST! Only VIC-20 could
compete with it, before the C-64 came out. Even CGA on the IBM's
was not really as good or as color rich.

I guess I have become practical in my old age..........sq

Speaking of hard drives, does anyone know how the development of
the IDE drive to the parallel bus on the XL/XE's is going? With what I
remember, there was some problem because IDE drives transfer informatio
n 16 bits at a time. I have heard though that there is a Seagate IDE
drive that tranfers at 8 bits. Does anyone else know about this?

>
> Richard Gore (RG9@UK.AC.YORK.VAXB)

There is a decoder file in the archive called dumas.arc which
is supposed to combine those files but it didn't work for me cuz
the file was corrupted either in the send or its corrupted in the
archive.
The thing you need to do is append the parts of the file together.
I do it on the atari by the copy command ie->
(assuming you have a command line DOS)
COPY D1:FILENAME.AB D1:FILENAME.AA/A and if there's more
COPY D1:FILENAME.AC D1:FILENAME.AA/A etc.
This is of course after you transfer the files to your atari from the VAX.

Well, after I was forced to change how I can get to my Internet account
site (am now dialing a local number, telneting to another local site, and then
telneting to my internet account site), I have been forced to UUEncode/UUDecode
programs, so as not to cause problems with the machines I need to telnet
through. The problem is, I haven't been able to successfully decode. I have
both YAU and UUDECODE.BAS, but the problem is similar, both give an error
message saying "begin" not found. I have tried this with MyDOS
and SDX, but still no luck. I know the "begin" is in the UUE file, and for as
much as I know about the file format of UUE, everything seems to be correct.
Any suggestions as to what to do next? I've tried a couple of different
files...

>>
>But see, you're missing the point. Ask not if the AC disk is PD, but
>how I can subscribe to the A.C. disk.

No, im not.

No one got upset when the question "Is Ataris old software been released to PD
yet" was aked recently.

The point is that his response was in my consideration far over blown in
response to the question I asked, and frankly im dissappointed that
the editor of the ONLY atari 8 bit magazine could not simply answer the
qusetion without 3 pages of belittling and preaching.

A simple NO, BUT WE INVITE YOU TO SUBSCRIBE would have sufficed, instead
of his HOW DARE YOU EVEN ASK response.

A response like that does not encourage people to BUY, expecially when sed
person has such make/break control over the magazine.

I previously DID send mail to Ben asking "WHERE TO SEND MY CHECK AND HOW FAST
CAN I GET MY COPY", but now im reconsidering that.

Steve

Steve Q,

Why view GIFs on my 8 bit? Well, maybe because I don't feel like spending $1000 for a PC just to view GIFs. It was just an example, and in COLRVIEW's 4096 color mode, even though the resolution is very rough, the pictures look quite amazing. I was quite surprised at the clown picture, and I've done some neat Saturn and Jupiter conversions as well, back when I had a GEnie account.
Anybody know if there is a planetary GIF site? Maybe I should check WUarchive, but that place is hard to look around in.

Rick,

Well, I guess the alternatives are either a separate processor running,
say as a PBI card, or no acceleration at all.
A separate processor running wouldn't be able to run CURRENT software,
just programs written to specifically do CPU intensive work on the
coprocessor card. At this point, I can't root too much for that.
This has all been hashed over at least a couple times that I can remember.
Either somebody swallows hard and gets on with the dirty work, or
we just decide that it'll never be feasible.

Jeff

Grover,

Your 800 used a 9 vold AC power supply. The 800XL, 600XL, 130XE, and 65XE
use a 5 volt DC power supply. Looking at the back of your computer,
the right half of the pins are +5v, the left half are ground.
If you were really desperate, all you really need is a 5v power supply rated
at about 1 to 1.5 or 2 amps, depending on how much extra hardware you plan
on stuffing into the 800XL, like memory, Transkey, Gumby, lots of stacked
cartridges, stuff like that. A matching din connector should be available at
your local radio shack. If you're really interested in building your own,
let me know and I'll do some measuring and get back to you with exactly
which pins carry +5, and which carry GND so you don't toast something.

Steve,

I'd say your honest attitude is the exception rather than the rule. I've seen several different instances where people were obviously looking for freebies: documentation, disks full of stuff, whatever, and when you even mention shipping and handling they get turned off. On the other hand, there are others who are terrific about registering shareware, sending S&H with documentation requests, etc. I'll also admit that I'm somewhere in between. All the commercial software I use is paid for, and almost all the shareware stuff I use is paid for. I even remember sending Bob Puff money for the use of ARC/UNARC, but I think I "OWE" him for Bobterm and Disk Communicator.

I'm not going to defend Ben's actions. It's not my job. But I will say that he DOES deal with a lot of rabble, groups of people who expect everything for nothing. Sure, he's the Alchemist, but even the Alchemist can get frustrated. Keep in mind also that Ben is not just managing editor, he's also editing EVERYTHING that goes into the magazine, plus he's the distribution editor, plus he writes material, plus he has a full time job and a house to run. He has no life of his own, he either works on the magazine, or puts in 8 to 12 hours a day at work.

Let's not over-react and get our feathers ruffled needlessly here.

Jeff

Jeff,

You must be in the wrong business. I get a bunch of VGA
monitors FOR FREE, many more defective monochromes (which I fix)
and even get free XT systems, complete with 30 Meg HD's for free.
Businesses just seem to want them "hauled off" when they upgrade.

Within the past year I donated dozens of working VGA, EGA
and CGA monitors to a local science educational institution. I
had no money in them, other than the fact I had to load them into
my truck.

Anyone who is devoid of an IBM compatable computer, and
wants one, I suggest you sniff around the trash bins of major
corporations- they toss out good stuff all the time! Most of the
time, there is only minor things wrong with the stuff, or NOTHING
wrong with them (other than they are ancient technology).

To properly view gifs in MY humble opinion, you should at
least use an XT with at least VGA or a minimum of EGA.....sq

(but to truly experience them, get a 1M Diamond Speedstar SVGA CEG
HI-COLOR card! CEG is Continuous Edge Graphics, HI-COLOR means
MILLIONS more colors than the Atari. View this card's output on a
Nanao monitor, 21" ones are nice! But let me add one important
thing, this is NOT power without the price! This is all the
power, and about 4 grand to buy the card and monitor retail....)

This light gun was garbage. I went through a lot of them and they were all
VERY inaccurate. Best Electronics sells a much better one, but it is pricey.
($30)

It's.. well... :) interesting. My MAIN dislike is 38 column editor...
then again, I do have what may be an older version of the editor
... at least from how the English manual desribes it...
but that has nothing to do with the 38 columns

i just wonder, tho... does the compiler care if you had, say, a 120 char.
line???

oh well... what I like is the way it made as many assembler-type
commands/routines VERY easily available to a dolt like me :)

i mean, just lately I've been noticing how S L O W a GET call is,
compared to a BGET and then PEEKs..
and this is even in TBXL with a RAMDISK!! <gasp>

are there any good disk-versions of the QuickMagazin's out there???

I'm really hungry for some demo source, and I've already looked over the
demos that <ame on the disk as mu<h as i <ould ;)

who out here has some qui<k that they've written &'d like to show us?

all I <an say that I've done is make a prettier DLI on the scroll.qik
demo :) ehhe

1782. Re: BART (not Simpson!)

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-30 19:22:52 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <ToND5B3w165w@cyberden.sf.ca.us>
Source record: 106740

Well, the system I use (<yberDen BBS, running Waffle on an IBM .. so it aint exa<tly FAN<Y! ;)) has a <ommand <alled "MUFUd"...

when I get something from BART in the mail, I say "D'OH!" jk ;)

I read part of the mail message, then, if its a 1-parter, I save it to my personal diretory (on <yberDen) by typing "write blah.uue"..

if it's a multipart, I go "write blah.uu1", read the next part (on the ar<hives, they <all it "ab", then <omes "a<", "ad", "ae", et<..) and save it as "blah.uu2", et<...

im sure the name isn't what matters... what the MUFUD <ommand does is look through all the files in my dire<tory and sear<hes for the

"Subje<t: "... line in a file (if it's text) ... it usually spits out massive errors (ie, my "finger" plan, my "join"ed newsgroups, et<.. all files whi<h are saved in my dire<tory..) but the main thing it does is look for

"blah - Part x/x"... I've gotten so used to uude<oding BART stuff that to me, it just goes

mail
<ret> - next
<del> - <an<el the "[More]"
w blah.uu1
<ret> - next
<del>
w blah.uu2
lets say its only two parts
<ret> - next ... opps, no more mail... ba<k to main menu
edit blah.uu1 - <all <yberden's file editor
e 17 - edit line 17 - here the "Subje<t" line when I get mail from BART is always line 17 ...
Subje<t: blah.ar< - Part 1/2 - I retype the entire line
..<hanging it from
"Subje<t: blah.ar< part aa/ab"
...whi<h stupid little MUFUD doesnt understand
s - save the file - ba<k to main menu
... do the same for "blah.uu2"....
mufud - <all mufud UUDe<oder
<ret> - YES, I KNOW! WARNING: DONT APPEND FILEs!
file - go to file area
l - log (same as "CD" in DOS)

user/phbill - my personal directory
s - send (ie, download)
blah.arc - there... im ready to download

then when i "Q"uit ba<k to the main menu, I use <yberden's "dEL" <ommand
to delete all the "blah.*" files from my dire<tory

anyways... as you <an see from above... it works pretty well... MOSt
UUencoded stuff, ie on "Binaries" newsgroups and such, dont need the
subje<t line <hanged, be<ause MUfUD understands it...
when I get stuff from BART tho, it gets mad at the "aa/ab" <rap..
who ever heard of a (lets see... 26 x 26 x 30K = 20280K file
for an Atari!? ;) ;) ;))

anyways/... MUFUD a<tually HATES appended stuff...
it prefers seperate files, then it looks for the "part " in ea<h
"SUbje<t" line, and the "begin"...

not sure about "in<ludes",as mentioned before

havent ever looked at ALL of a uuen<oded, MULTIPArT file!!! :)

We are right now working on the first english QUICK support disk. We (I
and Dean Garraghty) hope it will be ready in about two weeks. That will
be a double sided disk full of texts, source codes full of comments and some
new libraries.

There we'll also show how to use more than one DLI per screen. Perhaps that
looks nicer than your program, Bill ;-) ?

I don't see a use for a 120 char editor for QUICK, as you can't write
more than only one command per line (just like in assembler)...

1785. Dumasuu.arc

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-31 00:53:55 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1ubkv3$e00@usenet.INS.CWRU.Edu>
Source record: 106744

After awhile I did find dumas.arc. It's really called:
8bit/Cc65/dumasuu.arc

And it really is corrupted:

```
arc v dumasuu.arc
Name Length Stowage SF Size now Date Time CRC
============ ======== ======== ==== ======== ========= ====== ====
UUD.BAT 130 Crunched 30% 91 6 Jul 90 11:46a 7db4
UUD.C 6530 Crunched 60% 2639 5 Jul 90 9:49p 2f21
An entry in dumasuu.arc has a bad header. 768 bytes skipped.
UUD.COM 7003 Crunched 37% 4476 6 Jul 90 2:55p 831b
UUD.LNK 44 Crunched 7% 41 6 Jul 90 11:47a d72f
UUDECODE.C 6530 Crunched 60% 2639 5 Jul 90 9:54p 2f85
An entry in dumasuu.arc has a bad header. 768 bytes skipped.
UUDEXTRA.C 669 Crunched 31% 468 5 Jul 90 10:26p e66d
UUE.BAT 86 Crunched 19% 70 6 Jul 90 11:48a 4388
UUE.COM 7342 Crunched 39% 4524 6 Jul 90 4:26p 325c
UUE.LNK 31 -- 0% 31 6 Jul 90 11:47a dda7
UUENCODE.C 5345 Crunched 44% 3021 6 Jul 90 4:15p 855a
==== ======== ==== ========
Total 10 33710 47% 18000
```

It looks like this started out as a C program for IBM-PC's, then translated
for ST's twice, then translated to CC65 by John Dunning.

Does anyone out there have a working copy of this program, in it's 8-bit
version?

It's possible that XE-Term's Xmodem might use checksum instead of CRC for error checking. Also, if I remember right, you had to specify text or binary mode on XE-Term as well as on the host computer. Anyway, the best thing to do with XE-Term is to download Bobterm.arc (and unarc.com if you don't already have it).

1787. Re: Anyone have experience with XE-TERM?

To use the T: handler in a Basic program, you first have to load it. There was a file on the XE-Term disk called THNDLR.OBJ or something like that, that you would rename to AUTORUN.SYS. Unlike the 1030, the XM-301 doesn't have a built-in handler. The XIO commands for T: are different from those in an R: handler, but you can get handlers that create an R: device and respond to AT commands like any other modem.

Item 7110113 93/05/27 16:13

From: GENIE.MGMT Genie Management

Sub: New Pricing Effective July 1st

Dear GEnie Subscriber:

GENIE ANNOUNCES NEW PRICING:
SIMPLER, MORE AFFORDABLE, AND AS ALWAYS
THE BEST VALUE ONLINE

An Open Letter to GEnie Subscribers
From John Barber, General Manager of GEnie:

On July 1st, a new pricing structure goes into effect at GEnie. It's a big day for us -- the result of months of planning, number-crunching, monitoring and maneuvering around the competition.

And once again, we're looking forward to showing the online community that no one offers a better value than GEnie.

We have to admit that over the last few months, it's been difficult to watch the other major online companies, one after another, proclaim that their new prices make them "the ultimate value."

But rest assured, we do not intend to give up our leadership position as the best value online.

GEnie has always offered its subscribers the best combination of sophisticated services, information, entertainment -- and affordability.

And we've done it once again. Starting July 1st, GEnie will offer you the lowest hourly connect time of all the major online services; combined with a highly-competitive monthly subscription fee; and credit each month for up to four hours online.

Effective July 1st, this is GEnie's new U.S. pricing structure:

% Our monthly subscription fee becomes $8.95 a month.
% Our standard hourly connect rate drops to $3.00 an hour.
% And every month, you'll get a credit for up to 4 hours of standard $3.00 connect time.

It's about that simple. For our Canadian and international PDN customers, a complete price chart follows at the end of this

letter. It also contains the fine print regarding prime time, baud rates, etc., so it's worth taking some time to look over.

SIMPLY BETTER

You might notice one more important benefit to our plan.

We kept it simple. It's easy to understand, easy to live with.

For starters, we've simplified the pricing. All the services formerly in GEnie*Basic and in GEnie Value are now treated equally, and available at the same low price -- $3.00 an hour in non-prime time.

Multi-player games, downloading, computing bulletin boards, real-time conferences -- they're all just $3.00 an hour. (Half what you've been paying for GEnie Value services!)

GEnie*Basic services, yes, they're now included in the $3/hour group, too. GE Mail -- it's $3.00 an hour, with no limit to the number of messages. Internet Mail is now $3 an hour, with no registration fee. And don't forget. You also get a credit for up to four hours of $3/hour time, every month.

OK, NOW WHAT DOES IT MEAN TO MY MONTHLY BILL?

Let's cut to the chase. This is what everyone really wants to know.

The answer is -- for the majority of our users, it means very little change at all, or a change for the better.

When we started working on the price change, we studied the usage patterns of our active members to see who would be affected, and to what extent. We concluded that more than 85% would see about the same or lower bills at the end of the month.

For the people who like to keep to a strict budget each month, this plan offers a lot of flexibility and a broader range of services than before.

You have a set subscription fee. And for that fee, you get a credit for four hours of standard connect time to spend just about anywhere on GEnie.

There's no asterisk-chasing to make sure you haven't strayed into Value services. Less worry of credit card shock. You can even explore areas of GEnie you thought you couldn't afford before.

For the active users who spend significant hours a month on GEnie, especially in the former GEnie Value services, you should see a tremendous savings. The hourly rate is half what it was before -- and the best in the business!

Now -- who will see prices rise under the new system? Generally speaking, anyone who's accustomed to making unusually heavy use of GEnie*Basic services will have to change his or her usage to keep monthly bills down.

SO WHY CHANGE?

Maybe you're wondering why we're bothering to change the rate, if so few people are affected. After all, GEnie has had flat fee pricing for three years now.

Well, we did it for a couple of reasons. With our new pricing, we can continue to stay competitive in the marketplace, and we can continue to improve our service to you.

We found that, under the former pricing, a small number of our customers were making heavy demands on our service -- demands which began to outpace our infrastructure and capacity. The result was a level of performance that pleased no one. Not you. Not us. And yet, while other companies were eliminating or reducing their flat-rate access, we were holding to ours.

Something had to change. And a price restructuring was the best solution for the majority of our users.

Now, with the new rates, no one group of members is unduly favored; GEnie can continue to stay highly competitive among online companies; and we can continue to improve our service to you.

OTHER IMPROVEMENTS IN THE WORKS

There are other changes involved here besides our prices. "Staying competitive" means offering you better products, better service and better system performance.

Right now, we have a number of improvements in the works. We're developing new front-end software packages for Windows and Macintosh systems -- look for more on that over the coming months. We're making technical improvements to enhance our performance and speed. We'll be adding new services soon, along with new bulletin boards and of course, we'll continue to update our software libraries with more valuable files.

SOME THINGS NEVER CHANGE

GEnie has always been the very best service for people who really enjoy being online, and who expect great products and the best value for the time they spend with us.

That's not going to change. In fact, this new pricing structure should make it even easier for you to enjoy everything we have to offer. We're looking forward to seeing you online.

Sincerely,

John Barber
General Manager, GEnie

G E n i e P r i c i n g
(effective July 1, 1993)

1792. Re: Quick - english manual

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-31 04:30:34 UTC
From: Jeff_Mcwilliams@abcd.houghton.mi.us
Message-ID: <Jeff_Mcwilliams.0h69@abcd.houghton.mi.us>
Source record: 106752

Bill,

Hmm, interesting thoughts on Quick. It's been like December since I looked at the original version of the manual. Since I haven't purchased it, I haven't booted the disk since then either. I'll purchase Quick before
I ever use it, because I think that's only fair. Anyway, some things about it bothered me. For instance, it seemed that arrays were limited to 255 bytes in length. There are no logical AND, OR, NOT available for IF..THEN, DO...WHILE, and DO....UNTIL loops.
And you can't do mathematical evaluations like
OFFSET=y*40+xMOD8
On the other hand, Quick has some interesting features, like the built in mouse handler, the DLI/VBI stuff, and the fact that it's on disk, so you can possible run it off your hard drive, or off of two different computers at the same time.

I've spent years looking for the right programming language, looking at versions of BASIC, Pascal, C, even PILOT way back.
BASIC, or more specifically BASIC XL seems good for me for doing little test type things, like testing algorithms, or printer commands, etc.
I keep in online to run Turbofile/Turboword, so it's always there.
Action! seems good for me for doing anything more demanding and bigger, and if I am really hurting for speed or size I move to MAC/65.

Jeff

Steve,

If you REALLY want to view GIFS, use SUN Workstations with 1024x1024 color displays. That's what I use at school. GIFs are well, pretty and all, but they're sort of like demos. You load them up, state at them for a while, and then put them away.

There are no major companies in Houghton. There aren't even any minor companies in Houghton!

Jeff

1795. A new company to support the Atari 8-bit!!

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-31 11:15:41 UTC
From: djg0@aber.ac.uk
Message-ID: <1993May31.111541.9570@aber.ac.uk>
Source record: 106504

In just 8 days time I will be heading off home from University for the
very last time. After 3 long years, it's all over! So, what happens now?
Well, as fellow Atari 8-bit users, the answer will (hopefully!) please you!
After a lot of thought, and planning, I have decided to support the Atari
full time, by setting up and running a company supporting the Atari! Here
are some questions and answers about the operation:

What will the name of this company be?

At the moment, the name will probably be D.G.S., but this may change after
discussions with the legal people.

What will the company sell?

The company will support the Atari 8-bit only with the following products
and services: a large P.D. library with REALISTIC prices, an on-disk
newsletter (just a continuation of the News-Disk), the Digi-Studio system,
most PPP products (for the UK only): (QUICK, SAM, QUICK Ed, Rubber Ball,
Glaggs It, Minesweeper), new&used hardware and software, a software
exchange scheme for you to cash in your old commercial software in exchange
for P.D. disks, and lots of free help and support!!

Where will the company be based?

D.G.S will be based in a spare room at my house in Doncaster, England.

Who will be able to buy all this stuff?

ANYONE! Even if you don't live in the UK, it doens't matter. I already ship
to the U.S. now. We will continue to be able to accept payment in US$ in cash,
or UK pounds sterling in cash. And, who knows, one day we may even be able to
take credit cards!

Who will work for this company?

ME, and only me! In order to keep costs down, I will be the only employee.
By cutting costs to the bone, I can continue supplying quality software to
the Atari 8-bit community at REALISTIC prices. I am fed up of companies
charging utterly stupid amounts for items just for the sake of their own
bank balances. D.G.S does not aim to become rich! Indeed, I have worked out
that even if I do well, I will only scrape enough to just about live, if I
give up some luxuries, such as food!

So, what do you want from me??

Orders! Lots of support! The only way I can go on is by selling enough stuff to keep the operation ticking along. Tell you Atari friends about this new operation, post details to your favourite BBS!! Shout it from the roof-tops!!

What do you mean exactly by "realistic" prices?

By this I mean prices which I believe things are actually worth, not what somebody in a big office has to charge to pay all his staff, office rent, holidays abroad, etc.! For example, P.D. disks will cost as little as $2.50 each, and 95% of our disks are double sided, so you get loads of stuff for your money. Also, I don't include junk in the library. If I don't like it, it doesn't go in! We currently have 166 disks in the library.

So, where abouts are you again??

D.G.S. can be contacted at:

D.G.S.
62 Thomson Ave
Balby
Doncaster
DN4 0NU
ENGLAND

Phone: (0302) 855026 (from within the UK)
+44-302-855-026 (from outside the UK)
(09:00 - 19:00 BST/GMT only please!!)

Fax: Come on, I said I was keeping costs to a minimum!!

Email: djg0@aber.ac.uk

When does all this start to happen?

I am approaching the bank and all the relevant authorities on June 9-10th. That means I should be up and rearing to go on about June 15th.

Do you have a catalogue?

Yes, we do! It is currently available on disk, but I am having it printed in booklet style soon. These will cost $5 to send to the U.S. If you want one, then send $5 in cash to the address above, and you'll be one of the first to get one when they come back from the printers!

Any questions??

If you have any questions relating to all this, then please email me at djg0@aber.ac.uk.

Thanks for reading all this. I hope to be trading with you very soon!!

Dean Garraghty. djg0@aber.ac.uk.

1796. Bus interface between UNIXpc and Atari XL/XE?

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-31 12:31:18 UTC
From: charles@nybble.acs.com
Message-ID: <1993May31.123118.433@nybble.acs.com>
Source record: 106655
Cross-posted to: comp.sys.3b1,comp.sys.atari.8bit

[Crossposted to comp.sys.3b1 and comp.sys.atari.8bit]

Hello all,

I've been thinking lately about the two (pairs of) computers I own. Both have an expansion bus. The UNIXpc has a 10MHz 68010, so it has a faster CPU, but it has monochrome graphics and a slow serial interface. The Atari 800XL has a 6502, but it has a color display and can be persuaded to move serial data pretty fast (as those of us with Warp Dos XL from Happy Computers can attest).

I'm sure the UNIXpc has at least a 16-bit-wide data bus while the Atari's is 8-bit, and there are certainly cycle time differences, but has anyone looked into lashing these two beasts together? I have dreams of at least a reliable 19.2K serial interface for my UNIXpc via a loadable device driver.

Thanks for any opinions,

Charles Green charles@nybble.acs.com

> say as a PBI card, or no acceleration at all.

I want to make it clear I'm not at all against it. I wish that would have been the upgrade path Atari took vs the ST. There really are things that could use that kind'a speed increase. For instance, stuff like Speed Script refeshes a it's entire screen during a VBI. If we had something on the order of a 5X speed increase, even graphics(8) screens could be done during a VBI. I have been thinking about other esoteric hacks that are in my limited range of abilities<g>. Just something simple like a 6507/PIA/8k static ram tied on the buss: Doing something like loading the RAM from the host then letting the 6507 run. My three chip limit! There's a world of things that we haven't done that could be done with existing hardware. For instance, a cache in banked ram. If you booted up something like Ultima III, it would fill the cache with the disk info then only do writes/updates to disk. Same thing for any other software that doesn't use ram disk.

I've got a hard head, but our 6502C is fast enough for 90% of what I do. My complaints always run towards the tools that you use rather then the computer they were implemented on. ST Basic *SUCKS* the big one so I'll keep programing on the 6502 except when I have the ocassion to use Turbo C on my clone. I do have HiSoft Basic for the ST which is good, but still, W/O the inexpensive reference materials like I have on the 8-bit it's impossible to do anything cute on the ST.

Did someone mentioned the Creative Computing 8-bit Atari columnists? I became hooked on computers because of them and learned how great lessons from their articles. They were among the first who described accurately and very enthusiastically the mystical and powerful features lurking into an Atari computer.

The names: David Small, Sandy Small and George Blank.

There was another guy also in this team, John Anderson, who has been my mentor for years. In his columns, he was constantly believing in the superiority of the Atari computer over others in his class, even when times were difficult for Atari Corp. This guy learned me to recognize what makes a good computer. According to Michael Swaine, sadly, he died in the Chicago earthquake back in 1989.

Perpetual thanks to all those people who fostered my love for computing.

I have the following games for sale in new, unopened boxes, for
Atari 800/XL/XE computers (1 of each):

Joust (Atari)
Millipede (Atari)

Each has *slight* damage to the box but are otherwise fine. Make
an offer for one or both if interested, and please include $4.50
for first class, insured shipping in an insulated envelope (I feel
that it isn't worth the risk of losing the package to save a
buck or so in shipping costs).

Best regards, and happy gaming!

1800. UUencoders/UUdecoders

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-31 21:24:53 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01GYTZK2PU128ZEE6L@vax.edinboro.edu>
Source record: 106657

I have used to use the yau and yaue programs quite a bit and I noticed
that unless you had BASIC off there could be some problems. The other big
thing is EOL charactors. With all of todays technology, systems still seem
to disagree with how to handle and end of line. In order for the UUCP stuff
to work properly on an 8bit, the EOL chars. have to be ATASCII 155
(The standard 8bit EOL). Unix, CP/M, VMS, MAC, etc... differ from this so
EOLs must be converted.

The 'begin not found' error is often caused by this EOL problem. Also, like
others have said, you must concat. all the parts and make sure there is no
garbage in the file. I do belive there is a UUdecoder that works with
multiple files, but I have never used it (or mabey it just didn't work).

For anyone who has access to PCs, there is a really nice UUdecoder for MS-DOS
that is PD (or perhaps ShareWare). The program will sort through multiple
files and multiple parts within files and spit out a complete decoded
version. There is no editing or pasting necessary.. If anyone need it
I could probably get it to you....

-Adam Conover.
a644690c@edinboro.edu

P.s. For converting EOLs in files on the 8bit the is a program called
FILEFIX2 that works nicely. Otherwise you need an editor that can handle
large files and do a global search and replace. Atari Writer+ (128k) is nice
for this for files up to about 45k. Textpro is good too, but much slower.

All I know is that Bob Woolley has su<essfully installed an IDE drive
internally into one of his many 1200xl's..

unfortunately, it has no real handler (last I heard. ..whi<h i admit was
quite a while ba<k...) but what you do is run a program that <opies stuff
from the internal HD onto a RAMdisk..

that sorta turned me off ... but hey, I <opy everything to RAMdisk as it
IS ... soo :)

but I dunno .. I wouldn't mind a ni<e "IDEINSTL.AR0" on my MyDOS boot
disk to get everything going! ;)

maybe he <ould somehow sti<k a handler in an OS EPROM or something...
like he did with the [^F4] boot I have on my 256k 800xl OS 1200xl board

anyways.. I should <all him one of these days, shouldnt I? ;)

> And you can't do mathematical evaluations like
> OFFSET=y*40+xMOD8

Well.. I do sort of miss how A<tion! would handle arrays... but oh well

And when I look at the mathemati<al evaluations, like you des<ribed
above... yes...i <an imagine what a pain it'd be to do

A=10
Add(A,B,A)

or whatever.. but when you look at it... think of how little the
<ompiler needs to figure out, and how ungeneral things need to be

a good example of generalization is the OS draw routines... we all know
how slow THoSe are... but they are very versitile..

but if the language you are using is good enough, you <an write your own
spe<ifi< purpose <ode to do it, and it'll be mu<h faster..

anyways... I <an understand why PPP made Qui<k ... and how relatively
simple it must have been .... its more of a translator and less of a
<ompiler ;) ;) ;) (I wrote an xlator in BASI< on<e that took <ode
<ode that looked a bit like TBXL (never seen it ba<k then) and XLAtED it
into BASI< ... it handled While/Wend, Repeat/Until .. and other goodies)

anyways...i digress.. have you seen the eng. dox to Qui<K?

they show a ni<e, simple way of going about

IF A=1 and B=10

it's like this

IF A=1 THEN
IF B=10 THEN
do whatever you must when A=1 and B=10
ENDIF
ENDIF

Ive never programmed assembly, but I imagine its exa<tly like this, but
mu<h more <rypti<....

Sorry for the out of place comment (not Atari related), but I did something like this on a 6800 board running the Flex operating system. I wasn't sure how fast things would run, so patched the board with a register and programmable divider to select (I think) 8 steps from 1 MHz to 2 MHz. Reset condition was 1 MHz (stock). I think the fastest I could run at was 1.5 or 1.6. Same register also controlled a PROM/RAM switching setup ala the Atari XL's. (there .. it is about Atari's <grin>).

>($30)

Another alternative is to find a Sega Master System Light Gun and
hack it up. Don't know how well it works as I haven't gotten to work on
mine yet...
Below is an article I pulled off the net a while back.

Here's what ANTIC says about the Sega gun being used on the 8-bits.

from: "First Look Inside the XE Game System," ANTIC V7,#4, Aug.1988, p.42

"..If you're tired of waiting, you may wish to pick up the Sega light gun
for about $25 (when on sale) and modify it for the Atari.
" To modify the Sega gun for the Atari, you'll have to cut off the
incompatible connector. The wires must be stripped back and soldered
into an Atari joystick connector as follows:
SEGA GUN ATARI JOYSTICK PORT
Blue wire Pin 1 stick FWD
Gray wire Pin 6 trigger
Green wire Pin 7 +5 volts
Black wire Pin 8 ground
" Because of the close-fitting connections for the XEGS ports, don't
wire in a DB9 female connector that has "ears." Most joysticks don't
have wires for unused signals, so cutting up an old joystick may not
work. Specifically, an Atari joystick does not need the +5 volts, so
there isn't likely to be a wire connected to Pin 7. Howeverm you can find
joystick extension cables at Radio Shack [I don't think this is true
these days...check MCM Electronics...], which have all nine pins wired
>From male to female. [...Antic disclaimed responsibility for damages or
deaths...hehe]
" Once it's all hooked up, you'll notice that the gun fires when you
/release/ the trigger, which is annoying. The Sega trigger wiring is the
opposite of what the Atari light gun uses. To rewire the trigger switch,
remove the five screws (one is under the Sega logo on the side). Find the
trigger micro switch with three connections. Wire to the normally
/closed/ contacts instead of the normally open."

There ya go. Sounds like a bit of work, but I suppose it's worth it.
Does anyone know if the Genesis has a seperate light gun and if it works
identical to the Masters or what??

In a previous article, ricortes@TheRat.Kludge.COM (Rick Cortese) says:

>I want to make it clear I'm not at all against it. I wish that would have
>been the upgrade path Atari took vs the ST. There really are things that
>could use that kind'a speed increase. For instance, stuff like Speed
>Script refeshes a it's entire screen during a VBI. If we had something on
>the order of a 5X speed increase, even graphics(8) screens could be done
>during a VBI. I have been thinking about other esoteric hacks that are in
>my limited range of abilities<g>. Just something simple like a
>6507/PIA/8k static ram tied on the buss: Doing something like loading the
>RAM from the host then letting the 6507 run. My three chip limit! There's
>a world of things that we haven't done that could be done with existing
>hardware. For instance, a cache in banked ram. If you booted up something
>like Ultima III, it would fill the cache with the disk info then only do
>writes/updates to disk. Same thing for any other software that doesn't
>use ram disk.

Well, I have been thinking about the separate processor again, and how
I would love to take a couple years off from EVERYTHING, win the LOTTO,
and spend all my time doing neat thing for the 8bit.
If I could figure out what it takes to handle DRAM access properly,
and do automatic refresh on a 1 MEG SIMM, a coprocessor on a card
would be great. Similar to your 6507, PIA, SRAM, but with a
65816, VIA, DRAM, and maybe a D/A A/D so that I could write some really
cute stuff for my daughter that plays digitized sound without hogging
the 6502 CPU, thus maximixing the sample/playback rate, and avoiding having
to shut off ANTIC DMA. Obviously, this is WAY above the 3 chip limit.
I don't even have a clue as to what it would take to generate RAS/CAS,
and run a timer to halt the CPU and do automatic refresh. It vexes me, this
DRAM stuff, and I've got at least 2 data books on it.

>I've got a hard head, but our 6502C is fast enough for 90% of what I do.
>My complaints always run towards the tools that you use rather then the
>computer they were implemented on. ST Basic *SUCKS* the big one so I'll
>keep programing on the 6502 except when I have the ocassion to use Turbo
>C on my clone. I do have HiSoft Basic for the ST which is good, but
>still, W/O the inexpensive reference materials like I have on the 8-bit
>it's impossible to do anything cute on the ST.

I agree, but geeze, documents seem to be getting bigger these days.
I have Omniwriter, which can use up to like 128K of banked RAM, but
man, do a search and replace, or an insert/delete, and it's horrid.
Omniwriter is a gr. 8, 80 column display version of Speedscript.
And other programs are showing up, or being deveoped that could
potentially hog CPU like crazy. (you know what I mean).

1814. Atari 800 FOR SALE - * VERY MINT *

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-01 08:14:09 UTC
From: dh395@cleveland.Freenet.Edu
Message-ID: <1uf34h$icc@usenet.INS.CWRU.Edu>
Source record: 106673
Cross-posted to: misc.forsale,misc.wanted,cle.forsale,ba.forsale,comp.sys.atari.8bit,rec.games.video.marketplace

Atari 800 Computer for sale, VERY mint, still have ORIGINAL box, power supply, and (yes!) even the original Atari RF Cable.

Asking $70 OBO

Also, Atari 410 tape drive (works great) included free.

Reply via E-Mail

ACTUALLY, according to Wooley the technology is catching up to you. Turns out the new sims only need column refresh or something like that. You'd have to check it out with him 'cause "I'm not that bright" but I think all you have to do is have an interrupt occur at least every 10th of a second & the processor read a single byte from each 4k block or something simple like that.I guess a path of least resistance would be something like a Z80 that has it's own refresh built in, but I don't know enough about the chip to even dream of getting it to work.

1817. 6502 versions?

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-01 15:56:31 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01GYV2QEF1HU8ZEE9A@vax.edinboro.edu>
Source record: 106676

I was wondering if any of the XL/XE machines ever had a 6502 that
understood the NCR extentions.

Some of the instructions were:
INA - Inc. Acc.
DEA - Dec. Acc.
BRA - Branch Always.
PHX - Push X onto Stack.
PHY - Push Y onto Stack.
PLY
PLX
STZ - Store 0 in memory.

JMP (ind,X)

- indirect mode was added to many instructions.

- etc.

I wrote a little ML program in MAC/65 test some of the out on my XL, but
no luck. Anyway.... Does anyone know if these were ever suported by Atari's
custom 6502s???

1821. Re: clock speed, GIF decoder

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-01 18:20:10 UTC
From: potter@sunny0.DAB.GE.COM
Message-ID: <1993Jun1.182010.3804@ge-dab.GE.COM>
Source record: 106680

In a previous article, S. Quest wrote:

> Please don't shoot flaming firballs at me for this, but...
>Why would you want to view GIFs on an Atari? Straight VGA is very
>cheap today, and is MANY TIMES BETTER resolution than GTIA.

To which J. McWilliams replied:

>Why view GIFs on my 8 bit? Well, maybe because I don't feel like
>spending $1000 for a PC just to view GIFs. It was just an example,
>and in COLRVIEW's 4096 color mode, even though the resolution is
>very rough, the pictures look quite amazing.

and to which I'll reply: it's a nice niche I've found. I like doing it, and several dozen people have replied, saying they have thanked me for supporting the old Atari with APACVIEW and COLRVIEW. And why shouldn't we view GIFs on our Ataris? The C-64 and Apple II have GIF decoder/viewers, why not us too? Admittedly, it's a little like training a dog to talk, but it's fine for a 12 year old computer that would only set you back about $100 today.

If anyone gets a dual-processor, sped-up processor, or similar upgrade (or tells me how to interface a VGA board to the 8-bit), I'll code (or at least help the guy who does code) a GIF viewer to support it.

hey adam, this isn't that same MUFUD program I talked about Cyberden BBS
having?

I know they have a version for download, so I guess it's just a stand
alone EXE and Waffle (the BBS system) does some sort of shell-call to
MUFUD.EXE and has MUFUD output reports to either the modem (unlikely) or
to a file (ie, "MUFUD > temp.txt") and then the BBS displays the text (ie
"temp.txt") to the user (modem).

>
> P.s. For converting EOLs in files on the 8bit the is a program called
> FILEFIX2 that works nicely. Otherwise you need an editor that can handle
> large files and do a global search and replace. Atari Writer+ (128k) is nice
> for this for files up to about 45k. Textpro is good too, but much slower.

1) AtariWriter+ does 45k files with 128k machines!?

time for me to get out my AW+ docs and look into this! ;)

2) yes, textpro DOES get annoyingly slow :(... also, I still don't
understand why the text scrolling on Tpx works as it does.. I love AW+'s
... anyone understand the difference in the display code?
AW+'s scrolling intrigues me ;) ...

3) FILEFIX2 !?!?!?? Isn't that Bob Puff's double-block fixer for
DiskCommunicator!?!?! I mean, sure double-blocks may be the problem
(I've never in my LIFE found a problem with double-blocks with a DCM or
any OTHER downloaded file! What's with this!? Anybody have any DCM
problems which FileFix2 fixed up?)

1825. Atari 800XL system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-01 23:50:12 UTC
From: derekd@hpcc01.corp.hp.com
Message-ID: <1530002@hpcc01.corp.hp.com>
Source record: 106691

Hello,

I've been thinking about selling my 800XL for a long time now. But, have
not gathered enough courage to do so until recently (it's a great computer
for tinkering, but my wife is threatening to store it in the local dumps :{
just kidding... It's cleaning house time). Here's what I have:

- 800XL computer w/ 128K of memory (it should work almost like a 130XE
and, sorry, I don't remember what I did any more. I'll try to dig up
the schematic if the buyer is interested). *
- 2 1050 drives *
- Atari dot-matrix printer *
- Atari 300-baud modem.
- Cartridges: Action (a C-like language), Logo, and others.
- All the cables necessary to hook up the system.
- Atari reference books (including THE technical reference manual for
the Atari 800XL).
- Other Atari-related stuffs.

* the starred items are in original boxes.

Make me a reasonable offer and I'll consider it. Also, please email me
because I don't read this notes group very often.

Derek.

1826. 8-bit Atari Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-02 00:33:07 UTC
From: CURRENTM@carleton.edu
Message-ID: <01GYVIUZWZQ08Y5CAR@carleton.edu>
Source record: 106684

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 8-May-93

Additions/comments/corrections having to do with this FAQ List are
welcomed by its creator and maintainer, Michael Current, currentm@carleton.edu.

NOTE: I expect my address to change from the above to mcurrent@carleton.edu
around June 12 or so. If one bounces, try the other.

The 8-bit Atari FAQ List is posted on or about the first of the month to
the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many commonly
asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group. At this time the FAQ List is heavily geared toward describing the
various resources for the 8-bit Atari user available, with relatively little
information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. Hence no automatic
archiving of this FAQ List occurs, though there's usually a fairly recent copy
on the Atari Archive (see below) as the file 8bit/faq.txt.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
rec.games.video.arcade (includes products by Atari Games)
rec.games.video.misc (includes Lynx)
rec.games.video.classic (includes 2600, 5200, 7800)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the
Internet side of this discussion group. All contributions to the Info-Atari8

Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. John Dunning would like this fixed, but needs help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. Our 8-bit Atari Archivists are John Dunning, jrd@atari.archive.umich.edu, and Jody Lenn, lenn@atari.archive.umich.edu. The Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP
a) FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4)
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1)
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to: atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your Gopher server
doesn't provide a path to atari.archive.umich.edu, try the command:
gopher gopher.ius.itd.umich.edu

4. AFS
If your system has AFS capability, this is the easiest way to access the
Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.
It is especially important to specify that your upload is for the 8-bit
computers, since most of what Jeff receives is for the ST/TT/Falcon.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to

retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of
your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it
is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Free-Net via modem at (216) 368-3888. Those persons
with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts
are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG user directories are automatically
members of the official Atari user group CAIN - Central Atari Information
Network. Send correspondence and press releases to xx004@po.cwru.edu.

What print magazines support the 8-bit Atari?

Atari Classics (exclusively 8-bit)

TOP-Magazin

What product developers or vendors support the 8-bit Atari?
See the companion frequently posted text file, "All Known World-Wide 8-Bit
Atari Vendors and Developers" for complete information.

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note
that most require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Filename:
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80

File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible

XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

What are the pinouts for the...?

850 Interface Module

From: generic@rahul.net (Chris Rosenthal)
850 Interface Module, serial: (R1-R4)
R1:
Pin 1 Data Terminal Ready (DTR, Ready Out)
Pin 2 Carrier Detect (CRX, In)
Pin 3 Send Data (out)
Pin 4 Receive Data (In)
Pin 5 Signal Ground
Pin 6 Data Set Ready (DSR, Ready In)
Pin 7 Request to Send (RTS, Out)
Pin 8 Clear to Send (CTS, In)

R2:
Pin 1 DTR
Pin 3 Send Data
Pin 4 Receive Data
Pin 5 Signal Ground
Pin 6 DSR

R3:
Pin 1 DTR
Pin 3 Send Data
Pin 4 Receive
Pin 5 Signal Ground
Pin 7 RTS
Pin 8 -8 Volts

R4:
Pin 1 Send Data +
Pin 3 Send Data -
Pin 7 Receive Data +
Pin 9 Receive Data - (20 mA)

Map of connector is:
5 4 3 2 1
9 8 7 5

From: Jim Evans, donor@max.u.washington.edu
850 Interface Module, parallel:

8 7 6 5 4 3 2 1
15 14 13 12 11 10 9

Atari 800 Computer for sale, VERY mint, still have ORIGINAL box, power
supply, and (yes!) even the original Atari RF Cable.

Asking $70 OBO

Also, Atari 410 tape drive (works great) included free.

Reply via E-Mail

In article <01GYV2QEF1HU8ZEE9A@vax.edinboro.edu> Adam Conover writes:

| I was wondering if any of the XL/XE machines ever had a 6502 that
| understood the NCR extentions.
|
| Some of the instructions were:
| INA - Inc. Acc.
| DEA - Dec. Acc.
| BRA - Branch Always.
| PHX - Push X onto Stack.
| PHY - Push Y onto Stack.
| STZ - Store 0 in memory.
|
| - etc.
|
|-Adam Conover.
| a644690c@edinboro.edu

Those extra instructions were present in the 65C02, a CMOS version
of the 6502. Don't know if it was pin compatible with Ataris.

The latest version of MAC/65 mentions those extended instructions as
it supported their use.

Atari 5.25 inch diskettes are either FM (Atari model 810 SS/SD) or MFM (Atari 1050 dual density (single sided) or Atari XF551 DS/DD). Of the three, dual density disks will be the toughest to read in a non-Atari drive as part of the disk is in single density, and part of the disk is in an odd-ball double density mode.

There are also several disk operating systems for the Atari computers which use very different file management systems. AtariDOS (in its varied forms) uses a directory and sector alocation table located near the center of the disk, rather than the near the beginning sectors to average head travel. SpartaDOS uses a directory structure similiar to MS-DOS.

This probally doesn't help a lot, but there is some excellent literature available for each disk operating system describing how the disk surface is setup and used.

>Rick Cortese
>internet: ricortes@TheRat.Kludge.COM uucp: ...!apple!therat!ricortes
>
Well, from what I understand, that is one way. You only need
to read every column. On a 1 meg simm, which is 20 bits of address,
you only need to refresh 10 bits, which is 1024 locations.
So like you said, you could do a NMI every 10th of a second,
read 1024 locations, and consider DRAM refreshed. What I still can't
figure out, is how to generate CAS and RAS, and when the power is
first turned on, you have to pulse the DRAMS RAS/CAS signals or
something like that to get them "primed" for lack of a better term.
Automatic refresh is something a little different. You pull one
of the RAS/CAS signals low, then the other, and hold them. An internal
clock in the DRAMs automatically switches into action refreshing the DRAM
for you. Manual refresh sounds easier. You have to halt the processor
for automatic refresh anyhow, so might as well just do things
manually I suppose.

dh395@cleveland.Freenet.Edu (Steven J Tucker) writes:

ST> It doesn't matter at all which device (disk drives, etc.) you turn on
ST> first as long as the interface is --ON-- when the handler is called.

Try this little experiment...
o Turn on your disk drive.
o Turn on your ATARI 8-bit and load DOS.
o Now turn on your ATARI 850 INTERFACE after the boot-loading
of the DOS handlers and your device table has --ALREADY--
previously taken place.
o Now try loading the KERMIT-65 that uses the "R:" handler,
or try loading the BOBTERM with the built-in "R:" handler.

...KERMIT-65 and BOBTERM will report that the "R:" device has not been
added to the device handler table and that the system needs to be rebooted.

P.S. Of course you could append the "R:" handler device, but that
defeats the purpose of having the "R:" handler load and install from
off of hardware ROM.

MT>
MT> What is eight-bit-quoting anyway? I have not gotten any
MT> real answers when I asked people strickly in the PC world.
MT>
MT> Any help would greatly be appreciated.

"Eight-Bit-Quoting" is a method of sending an 8-Bit byte along a data pathway that it only 7 Bits wide. It works by sending what is called a "Quote Character" which tells the Kermit on the other side that the next byte is not actually a character, but "some bits left over" which should be combined with the 7-Bits of the byte sent before the quote character was sent. It essentially works the same way that the UUENCODE program works.

What this means essentially is that somewhere along your data pathway of machines transmitting your data is a machine that is probably communicating with a data word of SEVEN-EVEN-TWO, that is a 7-Bit wordsize (a.k.a. low ASCII or "regular" ASCII), EVEN parity, and TWO stop bits. A 7-Bit wide data pathway is considered "ancient" by today's standards, however that was the one main purpose that Kermit was written, namely, to transmit code successfully through these 7-bit wide data bottlenecks. A Kermit that does not allow for Eight-Bit-Quoting is absolutely meaningless! The whole --PURPOSE-- behind the writing of Kermit was to allow for 8-Bit quoting! You have an ancient machine or an old 7-Bit cable somewhere along the mailer pathways from the archives to your local host.

(By the way, besides using KERMIT, something else you could try is setting up XMODEM to emulate 7-Bit wide CP/M Ward Christensen XMODEM, which is known as MODEM-7 emulation. Some versions of XMODEM still provide for

this 7-Bit CP/M format. You may be able to get around your 7-Bit wide data bottleneck by using MODEM-7, provided that the local and remote machines can still handle the format. Good Luck!)

If you are connected to the USENET/InterNET via a UNIX machine, a painless method of converting <LINEFEED>/<CARRIAGE RETURN> combinations into ATASCII 155s is to use the UNIX system software tool "TR". One of the main uses of UNIX "TR" is in the converting of these various END-OF-RECORD/END-OF-SCREEN markers used by the jungle of hardware and peripherals out there.

VG> company $$$). I just want to xfer some files from a PC
VG> to my 800XL using XM301, because I have no ATARI 850.

No problem. Just wire up the modems, load up the terminal programs,
and type "ATA" on one machine and them type "ATDT" on the other machine
before the first modem has time to timeout, then wait for a "CONNECT".
(This is assuming that both modems use the HAYES Command Set...) This
method will work between two terminal programs because both programs look
for a "CONNECT" condition. However, this will not work between a Bulletin
Board Host and a terminal program because most BBSes will look for a "RING"
condition, rather than a "CONNECT" condition, and no "RING" will be present
in a local loop. (However, you can purchase what is known as a "RING tone
generator" at your local electronics hobby shop. A RING tone generator can
be used for such things as having a theatre stage manager cue a telephone
to ring onstage at a particular moment in a theatrical performance, for
example. Essentially you are just ringing the Bell on the phone.)

Steve,

Maybe to you it seems a fairly straightforward exercise to make an
accelerator via the Master/Slave technique you describe. But I have a
6th sense about these things. NOTHING is ever simple! Clock speed is so
ingrained into the very core of the 8-bit's design that to go monkeying with it
is to make changes that are bound to have unaccountable effects in other areas
not to mention software interactions. The whole idea gives me the willies.
I 'd rather see the pundits of the 8bit world put their energies into products
immediately useful to the market, such as a 256K upgrade for the 600XL or a
PAL programmer or a decent VT-100 emulator/KERMIT protocol for BobTerm.

A few months ago I recall you seemed to feel it would be a straightforward
exercise to make a CV-->TTL video convertor. Well, we're still waiting for
THAT, too.....

Rick,

Pseudo read ops are used to refresh drams in most
computers, and the refresh is usually performed every 17 to 28
milliseconds. I think I was playing with drams once, old 16k
chips and found that I could push the window out to 250+ms without
data loss, but that is pushing it.

Drams are nothing more than a matrix of charged
capacitors. Natural internal leakage causes them to return to the
ground state, or zero. The refresh cycle keeps the high state
bits at the high state by "recharging" them. Static rams (sram)
on the other hand doesn't require refresh, don't need to interrupt
the processor, and give faster cpu speeds because they use
transistors to latch and hold.................sq

(has anyone else stored and compared values in drams while
sequentially increasing the delay between refresh cycles? I would
be interested in exact figures, and figures for NEW chips, as I
did this in the early '80s just as an experiment.......)

1844. UUencoders/UUdecoders

It is: R.E. Marks' Fast UUencoder/UUdecoder. (It will handle XX coding
as well as UU, also).

> 1) AtariWriter+ does 45k files with 128k machines!?
>
> time for me to get out my AW+ docs and look into this! ;)

Well, 3 blocks of around 15k each. Each block has to be processed separately,
but the resulting save is one big file.

> 2) yes, textpro DOES get annoyingly slow :(... also, I still don't
> understand why the text scrolling on Tpx works as it does.. I love AW+'s
> ... anyone understand the difference in the display code?
> AW+'s scrolling intrigues me ;) ...

I *THINK* that TPx moves the text though the Screen Window where AW+
move the window over the text (with special handling for word-wrap
and such). But this is just a guess.

> 3) FILEFIX2 !?!?!?? Isn't that Bob Puff's double-block fixer for

Bob Puff's program is called FILEFIX, the program I mentioned is called
FILEFIX2. (Or perhaps the other way around). The names are similar but they
are different programs.

In article <1uhhqv$s7q@usenet.INS.CWRU.Edu>, cd827@cleveland.Freenet.Edu (Jeffrey J. McWilliams) writes:
|> Well, from what I understand, that is one way. You only need
|> to read every column. On a 1 meg simm, which is 20 bits of address,
|> you only need to refresh 10 bits, which is 1024 locations.
|> So like you said, you could do a NMI every 10th of a second,
|> read 1024 locations, and consider DRAM refreshed.

Well that would be one way. It would be saner to spread those refreshes around, say located in the VBI, or even finer (every 15 us or so?).
BTW, you access every row, not every column.

|> What I still can't
|> figure out, is how to generate CAS and RAS, and when the power is
|> first turned on, you have to pulse the DRAMS RAS/CAS signals or
|> something like that to get them "primed" for lack of a better term.

Create a faster clock than you would otherwise need (say 2X or 4X) and create gated versions of that clock for CAS and RAS. I've never heard of this "priming" when you first turn it on, though.

|> Automatic refresh is something a little different. You pull one
|> of the RAS/CAS signals low, then the other, and hold them. An internal
|> clock in the DRAMs automatically switches into action refreshing the DRAM
|> for you. Manual refresh sounds easier. You have to halt the processor
|> for automatic refresh anyhow, so might as well just do things
|> manually I suppose.

Normally you bring RAS low while you have the row address valid, then bring CAS low with the column address. If you instead leave RAS high and drop CAS, the chip goes into auto refresh. Interrupt the processor every so often (especially if it isn't always accessing memory, then it doesn't notice the missing state) and do some of these. Auto refresh is simpler when you do it this way, as you don't need to generate the address during refresh. In rare memory applications, you can guarantee the memory is accessed in the right way, and is refreshed by the application.

<<ough....>

Well, I BELIEvE it was the same thing whi<h literally fried (sniff, sniff
.. is that smoke!?!?!? I gotta go! Something's on fire in here!) one of
my xmm801 printer ports

well, the xmm is no biggy to me be<ause

1) i usually use the laser's at s<hool
2) it has 2 sio's (of <ourse), and the only thing that ever got hooked
up past it was the sx212
here, it goes:
1) rarely use sx212 ('<ept for downloading)
(using a borrowed 2400 on my dumb terminal)
(until i get an 850 or P:R:! ;) then its ba<k to bobterm
and a WONDERFUL 1200xl keyboard!)
2) I rarely have both printer and modem <onne<ted at on<e
ANYWAYS
3) going to hopefully get a better FASTER!!! printer when/if I get
an 850 / P:R:

as for the port on the 1200xl, it's miserable be<ause
1) it's the 256k 1200xl
2) it's the 800/800xl OS 1200xl
3) it's s<rewed into the base, and im lazy ;)

anyways...what exa<tly <AUSED all this turmoil?

that dumb terminal ... >:^(

ya know...the one with no "sea" key...

anyways.. for a while, i had both the 1200xl and the Dumb Terminal
<onne<ted to my poor, miseable, stupid SX212...

of <ourse, we all remember from reading above, that it was <onne<ted to
the printer...

hen<e, printer melted

so I had to <onne<t it to the 1200xl....
But WAIt! When exa<tly did I kill my 1200xl's port!?

I DUNNO! I HOOKED UP Both AS LittLE AS POSsiBLE!!!

but still, the SIO doesn't re<ognize a P:rinter and sends 99% garbage to
the R:S232 handler (via, guess what!? SIO!!)

so

im sunk at the moment

on top of this, i got disks full of Atari stuff that I need
to either upload or Mule onto IBM for a tea<her of mine so I
<an put it on his Ma<....

and I got a resear<h paper to write for English

and my girlfriend dumped me Sunday before last
and now she's being an utter twit >:^(

and i got senior ball to worry about

and a proje<t for E<onomi<s is <oming up soon, I think
(I have to write about a <orporation/<omany...
GUESS WHO I'M PI<KIng!
Yep! Atari! I saw today that AtarI's
sto<k was below $2 ... <sigh>)

oh well, just like the Egyptians, Atari In<. was on<e a powerful and vast
influen<e to the world

now they make ST's and Lynx's and buy expensive <ars for themselves ;)
^^^ btw - that's just a rumor I'v e
heard... but i dont find it
surprising ;)

Paul,

Regarding the Indus GT floppy drive power supply: From what I recall,
it's the same power supply used by your 1050 drive, or a 800 computer,
or a 400 computer, i.e. 9VAC.

Source record: 106609

Jeff P.,

Okay, yeah yeah. I remember reading somewhere else that a 4x clock
would help produce CAS and RAS signals.

Quoteth the Motorola Memory Data Manual, on the
MCM81000 1Mx8 SIMM module:

Device Initialization:

On power-up, an initial pause of 200 us is required for the internal
substrate generator to establish the correct bias voltage. This must
be followed by a minimum of eight active cycles of the row
address strobe (clock) to initialize all dynamic nodes within the RAM.
During an extended inactive state (greater than 16 ms with the device
powered up), a wake up sequence of eight active cycles is necessary
to ensure proper operation.

END QUOTE

was the refresh method you mentioned CAS before RAS?

The thing is, such a mode would require a little extra hardware to
reverse the the normal RAS before CAS read/write sequence.
For a beginning DRAM engineer, like myself, if I were to do the
project, I'd prefer to simplify the hardware a little, and do
all the ROW refreshes at once, during one interrupt, every 8ms.

Sort of the K.I.S.S. way of doing things I suppose.

Jeff

Bill,

Well, don't expect an 850 or P:R: connection to help if your SIO
port is toast. You need a qualified technician to get in there,
and see what components and/or circuit traces got wrecked. Sound like
maybe your VT100 terminal pushed some + or minus voltages through the
systems that shouldn't have been, and it passed through your various
peripherals into your computer.

Oh, and regarding speeding up the Antic. Haven't you been listening?!!
(sigh)

>

Ben,

I am still trying to convince myself that it will be
worthwhile to dig my Atari 800 hardware out of the box it has been
stored in for the past MANY years! Comp Vid to TTL is fairly
simple, I suppose I could dig out my TTL monitor, photocopy both
sides of the hack-in PCB that makes it a composite monitor,
identify the scant few parts, and mail it to you. That wouldn't
be too much work. You see, I used to run a green TTL on Atari's
and even as a video monitor for my VCR (with nasty trails) at one
time. I still have the monitor, and I assume it still works.

I have a lot of "must do" work ahead of any new projects,
and when I have free time- like just before I go to bed, I like to
get on the nets. I don't have a lot of extra time, nor motivation
I fear. Flipping floppies doesn't sound fun to me- that has to be
the major reason why I don't want to dig the Atari out of the box,
also that 40 column screen and mushy keyboard. And to think I was
one of the most loyal die-hard Atari fans at one time.....sq

(true that the Atari has critical timing alignments, but
conversely, it is one of the SLOWEST and EASIEST to hack computer
circuits I can think of! I like and know that system layout, the
chip selects are straight forward, adding more is NO problem. All
in all, building a high speed slave processor to gate out of a
patch of memory is not that big a deal. Simply tri-state the main
cpu, do your high speed thing, and allow the main cpu back on the

bus. Like I said, no big deal. Any engineer can tell you my suggestions are purely straight forward. In my job I often perform tasks such as this- but alas, I get PAID to do it. If I had money coming my way, the Atari projects might seem a bit more interesting. I am suffering job burnout I guess- hardware hacking is work to me, not hobby. I need to get money to have motivation. But if I were to somehow GET motivation, the things I could send your way! Say, you once expressed interest in my lighting controller circuit that uses the joystick (pia) ports to control theatrical lighting. I could photocopy that as well- or even send you the whole board, software and all! That is a fairly straight forward, simple, elegant, and easy design which is also USEFUL.)

>>DETAIL ON LIGHTING CONTROL CIRCUIT: This device operates with any Atari computer as a controller for it. The device reads a SMPTE timing track on a multi-track tape system (Tascam) and sends decoded timing signals to the Atari by pulsing a joystick fire button. The software on the Atari is written in basic, it simply sets up the ports as output devices, then reads for specific count numbers. At certain counts, it will change the state on the pia pins (joystick pins) according to the commands YOU PROGRAM. At timing intervals you define with IF THEN statements, it changes state on the pia pins to cause transistor drivers to saturate and pull in relays which control the lights. The software is completely programmable, and the first show I did with it was a lighting demo to AC/DC Back In Black on tape. The lighting changes were fast and smooth, and computer controlled- so they were always PERFECT. It has been used for several theatrical shows, sync'd to the tape. I don't have a schematic for a SMPTE encoder, but could whip one together easy enough- if I can motivate myself. I may even have the skiz for this controller somewhere filed away. Anyway, that's waht it is and does. <<

I saw this article in the current issue of ST-Report. I though it would be interesting to talk about it or maybe even support it.

> A FRESH OUTLOOK! STR Feature A few GOOD Ideas??
"""""""""""""""""""""""""""""

ATARIANS TRYING TO HELP ATARI
=============================

by Robert Dytmire

Since my article in STReport 9.20 I have received some very enthusiastic responses. Some questions were raised on how feasible the takeover of Atari really is. Well, if Atari goes to federal bankruptcy court and we, the users have bundled together a recovery plan AND some support from a major backer (Xerox is now a stockholder in Atari!). If Warner Communications could be convinced to support us, then the money issues take care of themselves. What these companies will want to see is a strong business plan and lots of support from the people involved. That means FIRM support of my general business plan, and ACTIVE participation from ALL the Atari users left. After all, several major companies have been bought out by their employees, why not a user group buying out Atari.

Some Details:

* Our purchasing power as a user group is, at the moment, rather limited. On the good side (for us) Atari's stock is now valued at $.88/share. That means $88 bucks will buy 100 shares! Now multiply that by 100,000 users we're talking 100,000,000 shares of stock (enough to control, maybe even buy outright-I'm having a broker check out the details) the company. Now, in my last article, I said you only needed to invest $15-$20 bucks apiece. I still stand by that for the following reasons:

1) If (when) Atari drives themselves into the ground the stock will be worth much less than $0.88/share. It could be bought for as little as $.10/share if Atari really screws up.

2) We only need to show that we are SERIOUS about this project and raise some REAL money and we'll be able to attract investors. Remember, it's Atari with the bad name, not us.

3) These big companies have no wish to lose money with Atari. If they see we're serious and think we can increase the value of their stock then they will be willing to take additional steps to secure their investment (namely, supporting us!).

EVERY USER COUNTS! I cannot stress this enough. Letters, organizers are NEEDED! If you have never done anything active in the Atari community, if you're reading this in a depressed Atari Community and you feel alone, and if your thinking of going Big Blue then HELP US and HELP YOURSELF! If you are a professional of some sort I NEED YOUR ADVICE! Please don't send any money until I can square away the legal aspects of this project. Organization is needed most RIGHT NOW, EVERY DAY COUNTS and I cannot continue this on my own.

If you know any investors have them contact one of the people on the list at the end of this article and they'll be happy to answer any questions they might have.

Some more details:

I think the best way to go will be for all of us to decide when and how much stock we will purchase. We then elect amongst ourselves a leader who will then be given proxy to vote with our shares. This will, in effect, allow us to control Atari through it's stock. You, the user, will form a block that effectively owns Atari corp. Later, when we've started to re-build, we can issue new stock and re-build the company.

Potential investors:

* Many professionals are always looking for a good deal, even if it involves some risk. Show my articles to your doctor/lawyer/boss and ask if they want to get involved. If they do, show them how to contact me and I'll be happy to work with them.

* Some large direct vendors of IBM clones are taking a beating in the current computer market. Our project may be just what they need to revive themselves. If our business plan is put together correctly, we stand a good chance of attracting a large, established, corporation as a partner in investment.

Additional comments:

* I have read Atari's dealer contract. This contract is probably one of the reasons Atari has such a hard time breaking into the market. I wouldn't sign the thing as written. I admire the current set of dealers all the more because of the risk of potential for loss they are taking (by Atari Corp itself!). One of the first things I would like Atari to do is hire a large customer support/tech staff and re-write that awful dealer agreement.

* The Falcon is an AWESOME machine, but I would like to tell you all a little story (and remember my last article):

In walked a couple looking to spend quite a chunk of money on a new system. They looked at the 386 system and then were shown the new Atari Falcon. The Falcon was shown very expertly to these folks. It's graphics, and built-in windowing features were displayed to perfection. Atari Works (which is the first piece of decent software out of Atari in years) drew their attention. The sale was all but made (I overheard the wife saying "I

WANT it!") UNTIL then husband asked the fatal question: "Can it run EXCEL?". After it was admitted the machine could not (at least not without an expensive emulator) they lost interest in the machine.

Why bring this up? Because it supports my argument that Atari MUST get the BIG TIME software houses supporting their platform AT ALL COSTS! Many users could care less if the machine preforms better than the box over there if the machine cannot run that nifty program that the box can (the old Beta/VHS story). Atari is rapidly painting itself into the BETA corner and can only get out my MASSIVE MASSIVE customer support and a re-tailoring of it's machines. Atari needs a customer support service that is second to none and a very liberal dealer agreement (they should go so far as to GIVE a demo unit to EVERY dealer). They NEED to get a contract with WAL-MART or K-Mart and most of all, they need to stop living in surreal world of their own design.

Does anyone have/has anyone used the windowing tool "screens" I know
it came out about 4 or 5 years ago.

What's the latest word on Quick. Is their an english version out? Is
there a stateside vendor yet?

Has anyone used Dataque's GOE system? Is it cart based or not. For that
matter, does it stack up well against PPP's SAM. (I have Diamond Gos 2.0
and it has something to be desired. Goe demo at the FTP site looked
promising, but i guess never saw the light of day)

Finally, can anyone recommend a good source of material concerning
arcade/adventure programming on the 8bit? I think I might do a summer
project.

Thanx in advance,
Mephistopheles

1865. PBI vs. ECI ports...

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-04 02:09:27 UTC
From: ai792@cleveland.Freenet.Edu
Message-ID: <1umasn$e4n@usenet.INS.CWRU.Edu>
Source record: 106620

I have been rummaging through my 8bit hardware notebooks once more,
and have started to continue trivial work on a few projects. Mostly
providing a simple general PBI board that provides the standard signals
and some additional ones, somewhat like the vaporware 1090xl box.
I, however, have a 130xe. The ECI provides nearly everything else you need
in combination with the Cartridge port, but one thing makes me sceptical.
The ECI does not provide the PBI External-Enable [EXTNB] signal.
Is there a way to simulate this signal, or must you merely change protocols
from the PBI one? If I understand thins correctly, the PBI EXTNB tells the
PBI-Device that it is enabled [In combination with Device Select at $D1FF].
Even using a combination of the READ/write and address decoding of $D8xx-DFxx
still will not work. How would one wire up a signal to the external ROM's
Chip Select [CS] line w/o the EXTNB signal? (Or is it provided by ECI pin A) ?

Thanks,
BRiTiSH
ai792@po.cwru.edu

BTW: Does anyone know if the XE Adapters can still be purchased, if so
where at? (Although I think Im too stuborn to buy it, when I can nearly
build it myself.)

Bill,

Perhaps the Black Box Enhancer is the only tool that properly lets you
do "Norton Utilities" type work on MyDOS type disks, especially anything
beyond 180K. I found that DISKWIZARD and similar utilities choke on
MyDOS, because the file links don't exist. Lemme see if I can remember
it right. Each sector has a byte that identifies which file that
sector belongs to. Useful for undeleting or rebuilding a file from
a bad disk. MyDOS doesn't seem to use it, and it causes problems with
your standard 180K type disk editing utilities. Luckily, I'm a Sparta
kinda guy, and DISKRX and CLEANUP work well. :)

Source record: 106629

This probably won't be of too much help, and you may have already thought of this kinda stuff anyway, but I can tell you how I did this on Atari DOS 3.0 before.
On there, the first three blocks are used to tell where all the files are. Also, when you copy a complete disk using the copy utility and only one drive, it will read and write those three blocks first separate from the rest.
So, I made a disk with a file that was 127 blocks long, and then copied its first three blocks onto the disk I had accidentally deleted stuff from. This allowed me to access all of the info on the disk, including some interesting stuff that I had deleted long ago!
There's probably an easier way to do it than that, though. Just giving my experiences.

1876. New support for the Atari 8-bit!

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-05 10:25:20 UTC
From: djg0@aber.ac.uk
Message-ID: <1993Jun5.102520.14052@aber.ac.uk>
Source record: 106556

In just 3 days time I will be heading off home from University for the very last time. After 3 long years, it's all over! So, what happens now? Well, as fellow Atari 8-bit users, the answer will (hopefully!) please you! After a lot of thought, and planning, I have decided to support the Atari full time, by setting up and running a company supporting the Atari! Here are some questions and answers about the operation:

What will the name of this company be?

At the moment, the name will probably be D.G.S., but this may change after discussions with the legal people.

What will the company sell?

The company will support the Atari 8-bit only with the following products and services: a large P.D. library with REALISTIC prices, an on-disk newsletter (just a continuation of the News-Disk), the Digi-Studio system, most PPP products (for the UK only): (QUICK, SAM, QUICK Ed, Rubber Ball, Glaggs It, Minesweeper), new&used hardware and software, a software exchange scheme for you to cash in your old commercial software in exchange for P.D. disks, and lots of free help and support!!

Where will the company be based?

D.G.S will be based in a spare room at my house in Doncaster, England.

Who will be able to buy all this stuff?

ANYONE! Even if you don't live in the UK, it doens't matter. I already ship to the U.S. now. We will continue to be able to accept payment in US$ in cash, or UK pounds sterling in cash. And, who knows, one day we may even be able to take credit cards!

Who will work for this company?

ME, and only me! In order to keep costs down, I will be the only employee. By cutting costs to the bone, I can continue supplying quality software to the Atari 8-bit community at REALISTIC prices. I am fed up of companies charging utterly stupid amounts for items just for the sake of their own bank balances. D.G.S does not aim to become rich! Indeed, I have worked out that even if I do well, I will only scrape enough to just about live, if I give up some luxuries, such as food!

So, what do you want from me??

Orders! Lots of support! The only way I can go on is by selling enough stuff to keep the operation ticking along. Tell you Atari friends about this new operation, post details to your favourite BBS!! Shout it from the roof-tops!!

What do you mean exactly by "realistic" prices?

By this I mean prices which I believe things are actually worth, not what somebody in a big office has to charge to pay all his staff, office rent, holidays abroad, etc.! For example, P.D. disks will cost as little as $2.50 each, and 95% of our disks are double sided, so you get loads of stuff for your money. Also, I don't include junk in the library. If I don't like it, it doesn't go in! We currently have 166 disks in the library.

So, where abouts are you again??

D.G.S. can be contacted at:

D.G.S.
62 Thomson Ave
Balby
Doncaster
DN4 0NU
ENGLAND

Phone: (0302) 855026 (from within the UK)
+44-302-855-026 (from outside the UK)
(09:00 - 19:00 BST/GMT only please!!)

Fax: Come on, I said I was keeping costs to a minimum!!

Email: djg0@aber.ac.uk

When does all this start to happen?

I am approaching the bank and all the relevant authorities on June 9-10th. That means I should be up and rearing to go on about June 15th.

Do you have a catalogue?

Yes, we do! It is currently available on disk, but I am having it printed in booklet style soon. These will cost $5 to send to the U.S. If you want one, then send $5 in cash to the address above, and you'll be one of the first to get one when they come back from the printers!

Any questions??

If you have any questions relating to all this, then please email me at djg0@aber.ac.uk.

Thanks for reading all this. I hope to be trading with you very soon!!

Dean Garraghty. djg0@aber.ac.uk.

1877. buying out atari

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-05 15:47:47 UTC
From: talmage@mentor.cc.purdue.edu
Message-ID: <C85nvn.5BI@mentor.cc.purdue.edu>
Source record: 106635

I read the article that Paul Hruby posted about people wanting to buy out Atari. I personally think that if it could be done, it might breath a little bit of fresh air into the ol' 8-bits. Some how convice them to open a small deparment (say 6-10 people) to do some research, answer peoples questions, and repair the hardware that people send in.

Then again this would be hard, to buy out Atari, because people are having problems forking out $9 for three disks. I don't think that it is too hard to support the people trying to keep our machines going. It just benefits everyone. They are not asking outragous prices, just enought to keep them motivated and sometimes just o cover he expenses that they incoure (sp). Ben, with my next paycheck i'm going to send you money for a subscription. And i applaude your efforts.

I know that most of us are college students with little money. If nothing else try saving a little and help support these people. Else in a few years we will regret it.

Just my two cents...

Mike

1878. Re: Upgrade an 800XL to a 130XE

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-05 17:28:04 UTC
From: phruby@ucrengr
Message-ID: <32277@galaxy.ucr.edu>
Source record: 106636

That is strange. My 130XE has no problem with playing Bezerk. Of course the version I have is the one translated from the 5200. (remember the talking Bezerk version). I don't think it is the OS. They are the same. Maybe the cart slot needs to be cleaned or the disk drive needs it. I have not seen anything that won't run on 130XE that will on an 800XL. Strange...

>kinda guy, and DISKRX and CLEANUP work well. :)

Aha! Talk about yer "timely posts." :-) I encountered a disk like this -- or close to it, anyway -- just last week, and wondered what the hell had written it! On the disk in question, the inter-sector "file links" were present, but the "file number" field was always zero, rather than representing a file's position in its directory as in AtariDOS 2.0. (This makes sense when you start trying to figure out whether a given file is "file #2" in the "main" directory, or in subdirectory "A," or in subdiretory "B," or what. You'd have to change the format of the file-number field to something that could represent this distinction, if you anted to continue using it, in MyDOS. From a programming standpoint, it's easier just to IGNORE that field and trust to God and DOS to never mis-allocate or mis-link a sector.)

Anyway, I found that SpartaDOS X liked this MyDOS disk-sans-file-numbers just fine, but that when I used one of the aforementioned DISKWIZARD-sector editors to rebuild the AtariDOS-style file-number fields I thought OUGHT to be there, SDX choked! On the other hand, it handles AtariDOS disks-with-file-numbers just fine. SOMEHOW, SDX seems to "know" whether it is looking at a MyDOS or AtariDOS disk. Anybody know whether this is actually the case, and if so, HOW SDX manages the trick? Enquiring minds, etc....

Maybe some enterprising Atari-loving person reading this could offer loans, in the amount of the cost of an Atari Classics subscription, in effect allowing the economically disadvantaged to support the cause on the "installment plan." Aren't most of you already paying for college the same way? Heck, maybe Ben could set something up directly, heheh... C'mon, Ben, what's one MORE huge responsibility? :-)

I'd offer loans myself but I'm greedy and would charge such outrageous interest rates that I'd never do any business... :-)

Sparta-Dos 2.x+ and SDX knows wether or not its a MyDos or AtariDOS disk
based off of the boot_sectors. [Sectors 1-3 contain the code to boot the disk
as well as various other information] I'm sure that Mydos, much like Sparta
has a data area [first 48 bytes] or at least a byte_flag specifying which
version of MyDos its running.

Quite trivial once you know some tech info about the various doses.

What Chicago earthquake? It was San Francisco.

Sorry, but I just had to clear that up.

Well, they've been realy big in the Mac emulation market on the STs. (But
they had an accident with one of their kids last summer, and haven't had
time for much of anything, or so I've heard.)

Make sure you are connecting to your Unix system at 8 bits. (I forget how to set that up in XE-Term, but I don't think it's a menu option. Check the manual.) This is the usually the biggest problem with uploading. Once you get this working, download a better term program (like Bobterm.)

> In a related question, is it possible to directly connect one of the Atari
> ports to my serial or parallel on IBM and transfer that way? I do NOT have
> an 850 interface, just this XM301 modem.

Well, here's something I just tried last night, and it worked:

1. Connect the modems to the phone lines in you house. Don't connect the Atari modem to the phone jack on the IBM modem because the IBM modem usually disconnects that jack from the phone line.

2. Make sure each computer is talking at the same speed. (300 baud if you're using a SX212)

3. Type ATO or ATD (I forget which one now.) on the IBM and set XE-term or whatever term program you're using up for auto-answer. (or dial with the Atari and hit ATA with the IBM)

4. You should get connect on both systems, and then can transfer at will. Just keep in mind that your phone line is in use, and you will be tying up the phone for as long as you are online.

I just tried this two nights ago to transfer a file from my Mac to my 8bit, and it worked just fine.

Just work with it and you should be able to get it to work.

Source record: 106645

Well, since I have to call long distance now thatI'm home, I can't log on as often, so here I'll go and post everything I've been thinking about in the past couple of weeks.

1. I've just got done playing with Daisy Dot II, the one from the archive, and I'm going to send in the shareware fee to get DDIII. Is it ten dollars as stated in the DDII docs or is it more, and does anyone have the most current address to send to? And also, does it support pictures any better than DDII?

2. I had a flash after using DDII. If I could use Atari Writer+ and produce my own printer driver for it, could I set up the different fonts to insert the \fROMAN\ whenever I wanted to change to the Roman font? (for instance)

3. I finally got a hold of an XF551 drive. I took it apart, and I was suprised at what little was inside!! The circuit board consisted of approximately four chips: an Intel 8050 (with the Atari name slapped on it), a WD1772 drive controller chip, a couple of 74LS chips, and a ROM chip. I'm surprised that nobody has come up with a clone of this to make it cheap to hook up 3.5" drives.

Well, gotta go, the system here is going down for back up.

>written it! On the disk in question, the inter-sector "file links" were
>present, but the "file number" field was always zero, rather than repre-
>senting a file's position in its directory as in AtariDOS 2.0. (This

The reason the file number is "always zero" is that these bits are used to link sectors on disks with up to 65535 sectors (or any disk with 1024 or more sectors, including enhanced denisty disks). One of the flag bits in the directory tells DOS which type of link a file has. I've found that the "Dis-kassembler" sector editor works well with Mydos, even on a hard disk.

Did you get the Atari graphic characters on your Okimate 10? I had one, and the documentation told how to get the international charactes or bit-mapped graphics. I gave away my Okimate and the documentation, but: The Okimate 10 CAN print color graphics, if you can get color ribbons and software that supports it.

1896. Atari.archive.umich.edu faq of sorts

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-06 22:26:14 UTC
From: weiner@terminator.rs.itd.umich.edu
Message-ID: <1utqu6$ifl@terminator.rs.itd.umich.edu>
Source record: 106654
Cross-posted to: comp.sys.atari.8bit,umich.archives,comp.sys.atari.st

[I thought I'd post this now, before I leave for vacation. Get your questions
in within the week, cuz after that: look out Eurpoe, here I come....]

The atari.archive.umich.edu "Just the 'faqs' faq" - an Umich Atari Posse Product

Recent changes are marked with a *

This faq has been revamped to provide just the "faqs", less talk
and more rock. Ready?

1. How the hell do I get to atari.archive?

By order of preference:
1. AFS (if you don't know what it is, you don't have it, forget I
mentioned it).

2. Gopher (Other gophers/North America/USA/Michigan/Merit/Software
* Archives or Popular Gopher Servers/Software Archives at Michigan).

3. FTP - Be sure to check for mirrors that are closer to home. For
instance src.doc.ic.ac.uk (/computing/systems/atari/umich) and
wuarchive.wustl.edu (/mirrors/archive.umich.edu/atari).
* wustl ran out of disk space and hasn't been keeping all of
us there. Please avoid it until they fix their problem.

4. Mail - Send mail to atari@atari.archive.umich.edu with a body
of help for the help file. Questions about BART to
brode@atari.archive.umich.edu

2. Uploads?

You bet we want 'em. Via afs, cp into /afs/umich.edu/group/itd/archive
/atari/New. Via ftp, ftp into atari/New (will not work at mirrors).
Via gopher, impossible, see mail. By mail, uuencoded chunks to
weiner@atari.archive.umich.edu.

3. Sacrifices in our honour?

You bet. Small children and farm animals only please.

4. Why the hell do things take so long to get from New to the
archive?

* Come on, things haven't been that bad lately, have they?

5. I'm completely confused by this post, who can clarify it for me?

I'll do my best, weiner@atari.archive.umich.edu. If that don't work,
weiner@terminator.rs.itd.umich.edu. If that don't work,
weiner@stat.umn.edu. If that don't work, weiner@beryl.labmed.umn.edu.
If that don't work, Jeff Weiner 414 Erie St SE #14, Mnpls, MN 55414.

* Although note that I will be on vacation from June 14 to July 5.
Look out Europe, here I come!
Good night,

1897. Atari 2600 info wanted

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-07 02:18:08 UTC
From: mwandel@bnr.ca
Message-ID: <1993Jun7.021808.14503@bnr.ca>
Source record: 106456
Cross-posted to: comp.sys.atari.8bit,alt.folklore.computers

This weekend I acquired an Atari 2600 VCS with 39 game cartridges at a garage sale for $5. I'd never really played with one before. Well, it is obvious that the machie is very primitive, yet some games achieve amazing effects like scrolling large parts of the screen horizontally and vertically or moving lots of high-resolution graphic objects around. I'd like to know what is in there. What I know: Crippled 6502 (6507), very little RAM (not enough for a video refresh memory), no interrupts, some sort of sprite facility (player-missile graphics?) I would like to know more. Discussions of this machine's guts have happened in the past and I didn't save any of the articles, would someone care to educate me?

Markus Wandel
markus@pinetree.org <-- I cannot receive e-mail at 'mwandel@bnr.ca' which is where this is posted from. Mail will not bounce, it will just disappear.

Ok, I miss something, what did Ben do?

Anyways, I've been despratly wanting to send in my subscrption to AC and
for AC Disk. However, everything that could possibly gone wrong has.
I've gotten sick, muffler fell of my car, needed new pants..etc..
PLUS on the IBM front there is os/2 2.1 and might and magic 5!
AND KB Toys has been having a clearance sale on atari carts for 1.97 each!
(I've gotten 2 dozen or so for my 800xl and my 7800)

So I'm hoping to subscribe come mid July. Ben has given me alot of help
in the past few months. I wish to suport his effords..

Source record: 106460

ok, I have a few questions. I have an Atari 800xl with 1050 disk drive.
(it has nooo upgrades..yet)
Anyways, I've been hearing alot about running 5200 games on an Atari computer.
1. Is this legal? I know it wasn't but I heard resently that atari made
all their old atari programs public dominion. If it isn't, never mind. :)
2. Assuming that it is, where do I find them and how do I get them?
(I haven't figured out how to get programs to my Atari yet, but one day
I might get a modfem for the thing.)
3. ok, I'm looking specificallu\y for Bezerk, Vangaurd, and Jungle Hunt.

This msg. was originally sent to M. Current, who said other people
(Jody Lenn) were the archivists. I'm posting here for general input
and also I can't find Jody Lenn's address in the Cleveland Freenet
Atari 8-bit group. Please note that I'm offering commented list
of files, not the files themselves.
Hi.

I am an avid collector of Atari 8-bit PD programs. I have

written a program I call DiskCat to catalog disks. It allows

a 65 byte description of each file on a disk. I have

cataloged about 860 files, over 8 megabytes of prgms. for

the Cleveland Atari Classics User Group. Now, I am thinking

of uploadng the catalogs, six categories, games,

communications, utilities, misc/finance, ams and

graphics/sound. I am not sure I should do this, since my

criteria for PD may not be quite so rigid as yours. Many of

the programs are from Analog and Antic magazines for

instance. The most questionable in the list are SmartDOS,

which I heard was put in PD, SpeedScript from Compute

magazine, High Res Dump from the PaperClip disk, all three

BASICs in file form. To the best of my knowledge, none of

the programs ever was or is now part of a commercial

software package, except those mentioned above. So, if you

are interested, I will upload the catalogs to umich.edu.

They six catalogs are arced data files for DiskCat, but

are simple ATASCII to send to your printer. Let me know.

Where would one obtain this "Dis-kassembler?" It sounds like it has abilities
beyond those of mortal men^H^H^Hprograms and yet I've never heard of it before.

>>Chris "30%, compounded half-hourly" Chiesa
>> Chris_F_Chiesa@cup.portal.com
>
>So you are trying to say that you couldn't save up $25 over a month or two to
>get a subscription??? Or better yet, $9 for a subscription to the disk????
>You are too funny....

Good Lord, NO. That wasn't what I was saying, or implying, at all. I have
no idea how you could possibly have come up with THAT interpretation of what
I said.

Someone (you?) mentioned that college students might have a hard time coming
up with $25 for an AC subscription. I recalled from MY college days that
a) it was nearly impossible to "save up" ANY amount of money at all,
b) $25 was an astronomical amount to spend on ANYTHING, and
c) if one ever DID come into $25 all at once there was always something MUCH
MORE IMPORTANT than an AC subscription to spend it on.
Therefore, it seems likely that if the $25 AC subscription rate could be
made LESS of an OBSTACLE for the college student (or other financially-strapped
but Atari-spirited party), AC subscriptions might shoot up to where "The
Cause" needs them to be.

And then I pondered how that $25 obstacle might be reduced. If, in my college
days, I had wanted to buy something that cost $25 (or more), and had to pay the
whole amount in a lump sum, I probably would not have done it. However, if
the seller had said to me, "pay me $1 a week for 25 (or whatever) weeks," I
probably WOULD have done it. It would be a lot easier to spare $1 a week over
a long period of time, than $25 all at once. It's a cash-flow thang. :-)

Putting these two thoughts/paragraphs together, then, I arrived at the
idea of "AC subscription financing plans," wherein some party buys the
poor college student his AC subscription "up front" or "on credit," then
collects payments over a period of time. There was a day when I myself
was so altruistic that I might have volunteered to perform such a function,

and not even charge any interest -- i.e. I'd collect exactly the $25 to cover the AC subscription, and no more, making no profit. Today, however, I am less altruistic and more profit-driven (it's funny how things change as you accumulate car, wife, house, etc.). I would NOT do it "for nothing," and probably also not "for just a little." I'd want to get a hefty percentage out of ANYTHING I undertook at this point in time -- not just AC subscription financing, but ANYTHING. So, while I can suggest the idea and throw it into the ring for discussion and possible action, I can ALSO see that I myself would

not be the best person for the job since in my attempt to make a hefty profit I

would make the plan too expensive, therefore unattractive, and thereby destroy its effectiveness.

Does it make more sense now?

Source record: 106466

I was in the bath yesterday, relaxed and my mind drifting form subject to subject (you know how it is), when suddenly this idea of buying out Atari popped into my head along with the name Nolan Bushnell (did I spell that right?), I seem to remeber Nolan saying that one of his regrets was selling Atari, plus every time I hear of him (books, newspapers etc.) he seems to have a new scheme up his sleeve. So how about convincing him to come back and help buy Atari out? Maybe the original 'Mr Atari' could come back and get the whole thing back on the road again, give us 8-bitters loads of support etc, etc.

Oh well, maybe I'm just dreaming here, longing for the 'good old days' even though I'm too young to remember the 'good ol days' hehehehe :-)

It is a nice thought though!

>like Bezerk ...

Hmmm, this reminds me of my 65XE, I have several games that play on my 800XL, but crash on my 65XE for apparently no reason at all. What's more these games work on my 130XE. All other software on my 65XE works fine, it is just a selection of games that crash. I have checked out the O.S. on each machine and they are all identical to each other. Maybe there is some obscure techincal fault at play here. One idea that strikes me is a loose chip somewhere. I'll have to take my 65XE and try pushing down on all the chips see if that helps. :-)

Anybody else have any ideas as to what could be going wrong here?

After getting some email about this I tried some more things out over the weekend. When running the XL translator I get a message that says cartridge present on the bottom of the screen. I also got this when trying to load another game.

Most of the time the software loaded crashes or shows no video. Can anyone help?

Nolan K. Bushnell was the genius behind the early Atari, although marketing
was his Achilles heel. Differences in marketing strategies caused the
Warner board to oust him (although their marketing didn't seem any better).
This was the same individual who laughed off Atari engineer Steve Job's
proposal to build inexpensive general-purpose computers. Of course, we
all know Steve left Atari and helped co-found Apple Computers. Nolan
has tried his hand at several unsuccessful ventures since leaving Atari,
the most unforgettable was trying to market personal robots. I'm afraid
we can't go back home again.

I have the following games that were converted from the 5200 for use on the
XL/XE computers. I believe a hacker group did these. The games are:
Centipede (more details than the computer version)
Xevious
Bezerk (talking version)
Super Pac-man
Jr. Pac-man
Gremilns
and a couple others I can't remember.

My question is are these pirated? Atari never released some of these to
my knowledge and never to the computers. If they are not pirated, could I
distribute them or should I erase them?

1916. Update - free vintage magazines to good home!

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-08 06:14:41 UTC
From: cyclone@netcom.com
Message-ID: <cycloneC8AHCI.61L@netcom.com>
Source record: 106474

The response was somewhat better than I expected! Many people offered to take the Antics, Analogs, and Atari Connection/Explorers off my hands. Currently the highest bids are $20 + shipping or $30 including shipping (after taking inventory my guess is that shipping may exceed $10 - there may be 40 or 50 lbs of magazines).

I will take one more round of requests, choose the recipient Wednesday night, and ship the magazines Thursday morning C.O.D., so please include an address and phone number with the bids (I'm leaving for vacation Thursday afternoon so if I don't ship them Thursday AM it'll have to wait a week-and-a-half).

If two bids are close I'll give preference to a)the couple of schools and user groups that have already written and b)the earliest message I receive. I'll send the lucky recipient e-mail to let you know the COD amount.

I did a more exact inventory. I have around 83 issues of Antic up through March of '90 except for #1 and #3 and approximately 65 ANALOG from #9 - #73 (there may be one or two issues missing in either set, as I didn't check every issue closely). The others are assorted Atari Connection/Explorer and possibly some other onesy-twosies.

Thanks for your response - those who don't end up with the magazines, keep your eyes peeled, 'cause next up will be the _ton_ of eight-bit software I have in the closet!

Specifications for the Atari 2600/7800

2600 7800

CPU: 6507 6502C (custom, NOT 65C02)
RAM: 128 Bytes, in VLSI 4K, high speed
ROM: 6K max 52K max
Cpu Clock: 1.19 MHz 1.79 MHz
Graphics Clock: 3.58 MHz 7.16 MHz
Slot Config: Rom access only Most CPU lines + video/audio
CPU Avail: less than 50% over 90%

Notes:
1. ROM specs are based on a non-bank select scheme.
2. Graphics Clock is the master clock used to drive the video chips.

Programming the 2600 in a nutshell.
The Atari 2600 consists of 3 important ICs: the CPU (6507),
the Television Interface Adapter (TIA or Stella), and the RIOT (6532).
The 7800 has a CPU (6502C or Sally) instaed of the 6507 and a GCC1702
(Maria) chip in addition to the Stella chip.

The CPU:
The 6507 CPU is a 6502 with 2 important exceptions: it only has
external address lines for 8K of memory and there are NO interrupt lines
connected. This is not as limiting as it seems if you examine some of
the games for the machine.

The Stella chip:
This chip makes all the video displays and sounds for the 2600 VCS.
It also has 6 registers which are used as A/D converters and for the trigger
buttons on the joysticks. The chip also controls the RDY line of the CPU
to initiate horizontal syncronization control. The chip is NOT a DMA chip.
The CPU must write each line of data into the chip registers AS it draws
the screen. This accounts for the low CPU availability. The Chip is addresed
through 44 write only registers, and 13 read only registers mapped to
the low end of page 0. For those familiar with the Atari 800, this chip
is about 1/2 of a TIA/Pokey in all respects. But, there is no ANTIC chip to
drive it; the CPU must do all the work that the ANTIC does in the 800.

The RIOT
This chip reads all the console switches (excluding power), the
joysticks, and other controllers. It also contains the only RAM in the
system and a general purpose timer. The RAM is mapped to the high end of both
page 0 and page 1. This means that it acts as both page 0 fast access memory
and the 6502 stack. The timer and I/O ports are mapped to Page 2 and 3.

In order to produce a video display, a program must do the following:
1. Start the vertical blanking interval
2. Start the vertical sync interval immediately
there is time for about 80 instructions after this
3. End vertical sync
the game computations must be done now as there won't be time later
4. End vertical blanking
5. Set up each line of the video display as it is drawn
there is time for about 6 instructions to the video chip before
the current line starts being displayed. Atari recommends changing
the display every other line to gain processing time.
6. Loop back to step 1

The Cartridge:
A standard cartridge contains the equivalent of a 2716 or 2732/2532
with one notable exception: the chip select line is active high, not low.
The high order address line of the 6507 (A12) is used as the chip enable.
There was at least one company that used EPROMs with a 74LS04 inverter to
compensate for this.

The Pinouts:
Note: numbers indicate left to right numbering

Top Row Bottom Row
Slot 2716 CPU 2716 CPU

1 13 D3 1 A7
2 14 D4 2 A6
3 15 D5 3 A5
4 16 D6 4 A4
5 17 D7 5 A3
6 * A12 6 A2
7 19 A10 7 A1
8 NC A11 8 A0
9 22 A9 9 D0
10 23 A8 10 D1
11 24 +5V 11 D2
12 12 Shield Ground NC Ground
* to inverter and back to 18 for chip select

Major differences between 2600 and 7800 mode:
2600 mode is default in the 7800. If it finds 128 bytes at the high
end of memory to match its encryption scheme, it will enable 7800 mode. There
is a small ROM inside the unit which displays the Atari pattern on screen as
it does this.
The 7800 mode is DMA driven, so the processor is free most of the time

to do other things, as the graphics chip runs 4 times faster than the CPU.
The 7800 cartridge slot includes 8 more lines: A13, A14, A15, R/W,
phase 2 clock, audio, video, and HALT (unique to Atari 6502).
The 2600 video has foreground/background, 2 player/missiles, and one
ball. The 7800 can display as many objects as the DMA can read in one line.
The sound is exactly the same as it still uses the Stella chip
(except Ballblazer which has its own sound chip in the cartridge).

80-FF Ram also at 180-1FF

280 Swcha Port A data register (joysticks...)
281 Swacnt Port A data direction register (DDR)
282 Swchb Port B data (console switches)
283 Swbcnt Port B DDR
284 Intim Timer output

294 Tim1t set 1 clock interval
295 Tim8t set 8 clock interval
296 Tim64t set 64 clock interval
297 T1024t set 1024 clock interval
these are also at 380-397

Atari 2600 ROM Memory Map

E000-FFFF Rom also 1000-1FFF
3000-3FFF ....

Wsync Wait for sync
This address halts microprocessor by clearing RDY latch to zero. RDY is
set true again by the leading edge of horizontal blank.
Data bits not used.
---
Rsync Reset Sync
This address resets the horizontal sync counter to define the begining of
```

horizontal blank time, and is used in chip testing.
Data bits not used.

Vsync
This address controls vertical sync time by writing D1 into the Vsync latch.
D1 - 1: start vertical sync
0: stop vertical sync

Vblank
This address controls vertical blank and the latches and dumping transistors
on the input ports by writing into bits D7,D6, and D1 of the Vblank register.
D1 - 1: start vertical blank
0: stop vertical blank
D6 - 1: enable I4 and I5 latches
0: disable latches - also resets latches to logic true
D7 - 1: Dump I0,I1,I2,I3 ports to ground
0: Remove dump path to ground

Pf0, Pf1, Pf2
These addresses are used to write into the playfield registers.

horizontal scan line map
(160 clocks, each bit =4 clocks)
Ctrlpf bit 0
bits 4-7 7-0 0-7 | 4-7 7-0 0-7
register Pf0 Pf1 Pf2 Pf0 Pf1 Pf2 0

bits 4-7 7-0 0-7 | 7-0 0-7 7-4
register Pf0 Pf1 Pf2 Pf2 Pf1 Pf0 1

Ctrlpf
This address is used to write into the playfield control register.
if bit is 1 then:
D0 - (REF) reflect playfield, see above
D1 - (SCORE) left half of playfield gets color of player 0
right half gets color of player 1
D2 - (PFP) playfield gets priority over players so they move
behind playfield
D5,D4 - Ball Size if 00, 1 clock wide
if 01, 2 clocks wide
if 10, 4 clocks wide
if 11, 8 clocks wide

Nusiz0, Nusiz1
These addresses control the number and size of players and missiles.
D5,D4 - Missile Size see Ball Size above
D2,D1,D0 - Player number/size
if 000, X one copy
if 001, X X two copies, close
if 010, X X two copies, medium
if 011, X X X three copies, close

if 100, X X Two copies, far
if 101, XX one copy, double width
if 110, X X X 3 copies, medium
if 111, XXXX one copy, quad width

Resp0, Resp1, Resm0, Resm1, Resbl
These addresses are used to reset players, missiles and the ball. The object will begin its serial graphics at that time of a horizontal line at which the reset address occurs.
Data bits not used.

Resmp0, Resmp1
These addresses are used to reset the horizontal location of a missile to the center of its corresponding player. As long as this control bit is true (1), the missile will remain locked to the center of its player and the missile graphics will be disabled. When a zero is written into this location, the missile is enabled, and can be moved independently from the player.
D1 - 0: allow missile to move
1: lock missile to player

Hmove
This address causes the horizontal motion register values to be acted upon during the horizontal blank time in which it occurs. It must occur at the beginning of horizontal blanking in order to allow time for generation of extra clock pulses into the horizontal position counters. If motion is desired, this command must immediately follow a Wsync command in the program.
Data bits not used.

Hmclr
This address clears all horizontal motion registers to zero (no motion).
Data bits not used.

Hmp0, Hmp1, Hmm0, Hmm1, Hmbl
These addresses write data (horizontal motion values) into the horizontal motion registers. These registers cause horizontal motion only when commanded to do so by the horizontal movement command Hmove. The motion values use the upper 4 bits of the byte. They are signed numbers with a +7 to -8 range. The positive numbers indicate left movement, the negative indicate right.
Warning: These registers should not be modified during the 24 computer cycles following an Hmove command. Unpredictable motion values may result.

Enam0, Enam1, Enabl
These addresses write into the single bit missile or ball graphics registers.
D1 - 0: disables object
1: enables object

Grp0, Grp1
These addresses write data into the player graphics registers

horizontal scan line map
(each bit =1 clock)

bits 7-0 if Refp0 (Refp1) is 0
bits 0-7 if Refp0 (Refp1) is 1 (reflected)

Refp0, Refp1
These addresses write data into the the single bit player reflect registers.
see above.
D3 - 0: normal
1: reflected

Vdelp0, Vdelp1, Vdelbl
These addresses write data into the single bit vertical delay registers, to
delay players or the ball by one vertical line.
D0 - 0: no delay
1: delayed

Cxclr
This address clears all collision latches to zero (no collision)
Data bits not used.

Colupb, Colup1, Colupf, Colubk
These addresses write data into the player, playfield, and background
color-luminance registers.
D3, D2, D1 - Luminance values 000 is dark, 111 is bright.
D7,D6,D5,D4 - Colors 0000 Grey
0001 Gold
0010 Orange
0011 Red orange
0100 Pink
0101 Purple
0110 Blue purple
0111 Blue
1000 Blue
1001 Light blue
1010 Turquoise
1011 Green blue
1100 Green
1101 Yellow green
1110 Orange green
1111 Light orange

Audf0, Audf1
These addresses write data into the audio frequency divider registers.
D4,D3,D2,D1,D0 - 00000 30KHz divided by 1
00001 " " 2
.....
11111 " " 32

Audc0, Audc1

```
These addresses write data into the audio control registers which control
the noise content and additional division of the audio output.

bits value noise type division
D3, D2, D1, D0 - 0000 set to 1
0001 4 bit poly
0010 /15 into 4 bit poly
0011 5 bit poly into 4 bit poly
0100 divide by 2
0101 divide by 2
0110 divide by 31
0111 5 bit poly into /2
1000 9 bit poly
1001 5 bit poly
1010 divide by 31
1011 set last 4 bits to 1
1100 divide by 6
1101 divide by 6
1110 divide by 93
1111 5 bit poly divided by 6
---
Audv0, Audv1
These addresses write data into the audio volume registers which set the pull
down impedance driving the audio output pads.
D3, D2, D1, D0 - 0000 no output
....
1111 loudest output
---

1918. 800xl help please....

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-08 07:15:31 UTC
From: dstuart@desire.wright.edu
Message-ID: <1993Jun8.021531.10268@desire.wright.edu>
Source record: 106476

Wonder if anyone can help me with info I need. Here is the problem...

I have an Atari 800xl from way back when and I have pondered recently if I could use it to connect from home to my school's system. what I need to know is the following...

1. I don't have a disk drive for it, how can I get one (anyone selling a 1050?).

2. How can I get a Modem for the machine? how can I get a terminal program for it? and What would be the maximum baud rate the modem could support?

3. How available is software for the 800? Is there an ftp site of shareware?

4. Can you still get a printer and interface?

Help if ya can,

Thanks Dave

1919. 850 info wanted

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-08 12:18:22 UTC
From: borgen@stud.cs.uit.no
Message-ID: <1993Jun8.121822.18227@news.uit.no>
Source record: 106477

What is the 850 really? Is it hardware only, or does it have anything like
software inbuilt?
I still have no floppy drive for my 800XL, but if I could just transfer
software from my Amiga to the Atari then I would be very happy. Will the
850 help anything?

Thanks in advance.

Are you holding down the OPTION key as the computer boots up??? It sounds like the internal BASIC is not being de-selected and is actually in ROM (which tends to screw up most game software). If you are trying to de-select the BASIC ROM, and the translator says that it has a cartridge installed, then maybe your OPTION key is broken.

|>
|> Hey Jeff.... ever going to make a GIF -> @olrView or vi@e-versa
|> @onverter?
|>

Just what I'm working on these days (among other things): a GIF to
ColrView program. I gotta use either the RAM under the OS in an XL
(which disallows SpartaDOS) or one of the XE banks (like maybe the
highest one?). What do the masses say as their choice? Or maybe allow
selection upon loading?

|> And to be able to make @.V.'s into GIFs would be QUITE ni@e, as well! :)

Not really possible: ColrViews (GR.9) allow 4096 colors. GIF is limited
to 256 colors.

|> And what ever happened to GIFN@ODE? I want some APA@ supported!

You want to create GIFs from APAC pics? If you created the APACs from
GIFs you already have the source :^) But seriously...I'll be looking
into ways to go back to GIF from the aforementioned ColrView program.

|> I hate to bug ya about this ... :) It's just, I've tried a little (well,
|> looked over some sour@e and a "bitmapped graphi@s" book, and found that I
|> ARE 2 DUMB 2 NO HOW 2 DO DIS! ... ;))

hehe...everyone should learn how to code an LZW decoder...builds character:^)

|> what lang. did you make APA@View in?

All assembler. Used the ancient Atari Macro Assembler (AMAC).

|> are you ever going to put up some PD sour@e / routines for viewing APA@ /
|> APA@-Il@ / @olorView ????? 8^9

See E. Halliwell's ColorSquashView for source code on how to display in
ColrView. Watch your mailbox for future issues of Atari Classics :^)

The 850 (AFAIK) has 4 serial ports and a parallel port. It's got firmware built in... Groovy beeping noises when you start up ;) I don't think there's more than the device handlers for Rn: (the serial ports) there, though. Connecting it up to the Amiga shouldn't be a problem... You'll need kermit, zmodem or similar (on both sides... Uh, I guess you'll just have to write one yourself for the Atari, unless you already have it on tape ;).

1923. 8bit readers list

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-08 15:04:50 UTC
From: vparada@inf.utfsm.cl
Message-ID: <1993Jun08.150450.24592@dcc.uchile.cl>
Source record: 106481

Hola mundo.

I have received about 20 names and addresses of those who read this
group at least once a week.

I know we are more than that, just by reading the posts of the group.

I don't want to pick the addresses from the signatures, because
some of them just want to ask for something and be replied directly.

If some of you can't post directly to me, just reply this post to the
list.

The format I want to store is:

vparada@inf.utfsm.cl Victor Parada G. (some info)

so, please include a line like this in your posts.

I'll store only ONE address in the "database", so send (or re-send)
the most important (I took the first from the signatures or the one
on the 'from:' field when not specified).

Bye... ++V

A very interesting document. (That 650x code sure brings back memories of Commodore 64 machine-language hacking :-))

Is there a PD/Shareware Atari 2600 emulator (for the PC or Unix) for testing such code? It would beat buying an EPROM burner/eraser.

>
>Well, here's something I just tried last night, and it worked:
>
>1. Connect the modems to the phone lines in you house.

Doing that would put the telephone company "signal" on the line,
like a "tooooooooooooooo-toot-toot-toot...", producing a dirty
communication, or not?

>Don't connect the
>Atari modem to the phone jack on the IBM modem because the IBM modem
>usually disconnects that jack from the phone line.
^^^^^^^^^^
So, connection is by microwaves!!! ;-)

>2. Make sure each computer is talking at the same speed. (300 baud if
>you're using a SX212)
>
>3. Type ATO or ATD (I forget which one now.) on the IBM and set XE-term or
>whatever term program you're using up for auto-answer. (or dial with the
>Atari and hit ATA with the IBM)

Dial a dumb number??? The telephone company will try to do the
connection...

>4. You should get connect on both systems, and then can transfer at will.
>Just keep in mind that your phone line is in use, and you will be tying up
>the phone for as long as you are online.

A 300 baud connection would take a looong time...

>I just tried this two nights ago to transfer a file from my Mac to my 8bit,
>and it worked just fine.
>
>Just work with it and you should be able to get it to work.

Well??? ++V

Source record: 106485

Dave,

American Technivision
1-510-352-3787

Advertises in Atari Classics Magazine a printer interface for
$43.95 allowing you to connect any standard Centronics Printer Port
type dot matrix, inkjet, or laser printer to your computer.
May also have some disk drives.

Toad Computers
410-544-6943
570F Governor Ritchie Highway
Saverna Park, MD 21146

Buys/sells used 8 bit equipment, and may have a large supply of 1050's
and other stuff.

B&C Computervisions
408-986-9960
2730 Scott Boulevard
Santa Clara, CA 95050

Sells all sorts of stuff, including (I think) a good set of public domain
disks, which would *probably* contain Bobterm, Omnicom, and/or
Kermit 65, which all are recommended for various uses.
They also sell hardware, so check them for printer interfaces,
disk drives, etc.

With an 850 Interface, or P:R: connection, the two most popular
means of connecting a standard RS232 type modem, you might get speeds
of around 9600 baud. If you purchase a Black Box from Computuer
Software Services, you can push modem speeds in the 19,600 buad
range, taking advantage of the latest v.42/v.42bis v.32/v.32bis
modems.

The Black Box also has a printer port, and lots of extra goodies,
and options. Call C.S.S., tell them the Atari Classics Staff sent
ya, and request their latest catalog.

C.S.S.
P.O. Box 17660
Rochester, NY 14617
716-429-5639

There are other hardware options for RS232 and printer ports, I've
listed the most popular ones.

The terminal program you use will depend on the requirements of your
school system. If you need VT100 capability, you'll want to look
into Kermit 65 or Omnicom. These types of programs have a
speed limit of around 2400 baud. With a P:R: Connection,
Omnicom started losing incoming text at 2400 baud.
If Itay Chamiel ever decides what to name his term program, and
to write a manual for it (ahem!), I would highly recommend it.
It's user friendly, and can keep track of incoming data lots better
than Omnicom can. It does not do any sort of file transfer protocols
at this time though.

Bobterm is an excellent (the best) general purpose telecomm. package,
and would be recommended for connecting to another 8 bit system,
BBS systems, or to your school as a dumb (ASCII or Glass TTY) terminal,
or as a VT52. It supports XMODEM, YMODEM, FMODEM, and text capture
and send protocols.

Anything else?

1927. Re: Upgrade an 800XL to a 130XE

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-08 18:33:25 UTC
From: vparada@inf.utfsm.cl
Message-ID: <1993Jun08.183325.23165@dcc.uchile.cl>
Source record: 106484

Hola mundo.

I had to modify some code of a dumped copy of some cartridges in order
to start them on my 800XL.
One of the behaves I recognized was updating the PORTB registers trying
to initialize joysticks 3 and 4, enableing BASIC and "destroying" game's
code.

Also, I wrote a runtime translator (dumped from translated 800XL), that
can be appended at the beginning of some games that require translator.

Xao... (Bye...) ++V

1928. Atari 8-bit and peripherals for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-08 22:25:00 UTC
From: cohen@BORN.phys.virginia.edu
Message-ID: <0096DBB2.AFBC1900@BORN.PHYS.VIRGINIA.EDU>
Source record: 106497

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).
I will respond to every e-mail message I get here (if you get no response,
please try again). PLEASE FEEL FREE to make any offer! I intend to finalize
sales within a few days, and will accept immediately offers that look very good
(if there will be any).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Printer- Epson RX-80F/T in excellent condition, extra ribbon.
Printer- NEC 2050 letter-quality personal daisy wheel wide carriage-
this is a smaller, personal computer model, NOT the heavy office model.
Monitors-
1. Commodore 1702 color monitor, one of the best color monitors
available. In mint condition.
2. 10" color monitor with composite video and sound.
3. Green monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.

Atari CX853 16K RAM memory module for Atari 800 (I have 2 units)
Axlon RAM CRAM 32K memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
MPP CARD?/AT centronics parallel printer interface (hooks up a standard parallel
printer to Atari I/O port, no need for 850 unit).
Atari power supply model # C061982 (for the XL/XE series I think).
Atari 1027 Letter Quality 80-column impact printer in excellent condition,
in original box with all cables and manuals
Another 1027 Letter Quality printer almost new, in original box, but does
not work properly
Atari 1020 Color Printer/plotter in original box, manual, all cables.
Another Atari 1020 color printer/ plotter with manual.
Yet another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Joysticks- various types and shapes, all tested and working well.

Paddles- a pair of Atari paddles - NEW never used
Paddles- a pair of Atari paddles - used
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)
Atari 1010 Program Recorder - I have 2 units, Work fine.
Atari 1010 Program Recorder - save: ok, load: no.

4 DISK DRIVES-
2 Atari 1050 drives, 2 Atari 810 drives, all sold as is.
They had various levels of problems, the 1050 spins and the light comes up
but it won't load, and one 1050 and one of the 810 were dead as I recall.

A pair of Atari radio remote control joysticks-
purchased used and never tested by me, because
I do not have the 9V batteries needed to operate them, sold "as-is".
Cosmetically they look very good, though.

***** SOFTWARE *****

Cartridges-
==========

BASIC (CXL4002) with manual
Imagic Atlantis with manual and original box
Centipede with instructions
Missile Command
Activision Space Shuttle
Imagic Demon Attack
AtariArtist cartridge
AtariWriter Wordprocessor with manuals and original box

Disks- (All are original disks)
======

Lode Runner with manual and original box
TimeWise with manual and original box
Epyx Summer Games with manual and original box
Strategic Simulations Inc. Computer Baseball with manual and original box
Temple of Apshai with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Pinball Construction set with original binder and manual
Infocom Zork I with manual and original box
Micro League Baseball with manual and original box
Micro League Baseball General Manager/Owners Disk with original box
The seven Cities of Gold
Atari Translator
Ghostbuster by Activision
Atari DOS 2.5 with manual

plus about 100 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
Joystick Sketchpad with manual (used)
apx Eastern Front 1941 (with manual and original box)
Thorn EMI Compute 4 and Reversi (in original box with instructions)
Atari Statistics I (with manual and original box)

Books-
======

Bill Carris- Inside Atari BASIC
Compute!'s First Book of Atari
Compute!'s Second Book of Atari
Gardner- Software Protection and Code Breaking (book only)
ICD SpartaDOS Construction Set
Your Atari Computer
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

1929. Classics Disks &tc

Source record: 106486

Well I just returned from a week's holiday & catching up my email, following the thread generated by discussions among Steve Tucker, Jeff McWilliams & Mike Clemmons.

First, I'd like to point out that my initial post on this subject did not mention anyone specifically by name & did not bear the character of a "flame". While I suppose it's possible I overrreacted a bit, the subject of folks coming onto the Net & inquiring about freebies- especially from AC- is one that perhaps I'm overly sensitized to. The sad fact is, that for every 3 people who profess interest in the old machines, only 1 will actualy spend money to purchase hardware/software/publications related to it. It has been the single most sobering observation I've made since I got involved with Jeff's Mail Campaign back in '91. In talking with other vendors/developers, this same figure keeps cropping up. They all seem to know about it & adjust their scales accordingly, but I only just discovered it & the trauma hasn't quite yet worn off. It's probably a good thing for the 8bit community I didn't know this 2 years ago, or I'd have told Jeff McWilliams to go climb a slippery dillweed when he first proposed the novel idea that has since taken life as AC.

While it's true that I'm the main person responsible (at the moment, anyway) for AC, I feel undr no obligation to behave/respond in a "professional" manner. I'm not a professional in the publishing industry, I'm just another user like all you guys are. I reserve my "professional" behavior for my job, that alone should earn me some kind of special consideration at the Pearly Gates (assuming I make it there). But in my capacity as Managing Editor, Circulation Editor, & occasional Contributor to AC, I see myself as no different than any other 8bitter & have no intention to do other than to express myself as I see fit. Most everyone out there already knows I'm a Crusty Old Fart anyway. And those who are perceptive are glad of it. Because what I'm doing with AC is not a job for wimps or the faint of heart. You either get AC with a Crusty Old Fart, or no mag at all. At least there are 480 hardy souls out there who elected the first option.

I received several private responses to my post in which I railed against the "something for nothing" mentality which has been so destructive to our collective 8bit interests. They were all in similar vein to the remarks posted by Jeff McWilliams & Mike Clemmons. Mike is obviusly a veteran of this market, he seems to perceive the value to our continued existence that AC represents.

Nice try, Chris, but I don't think I'm gonna lead a crusade to save the monkey show out there in Sunnyvale. As far as I'm concerned, Atari ceased to exist as of Jan. 1, 1992 (the date they officially stopped supporting the 6502 machines). I can never look back to Sunnyvale, & in any event I have deep, cynical distrust of Korporat Amerika (I work for the world's 3rd

largest drug company). Sure, I might get interested if they promised to renew support for the 8bits. But even if they did promise to hire a half-dozen 8bit support people, even if they put it in writing sealed by the Pope, it would be a lie. Mark my words, they would wiggle out of it. Because the market just isn't there. The opinion of the Corporate Moguls is that the 8bit market is mostly made up of people who won't spend money. And sadly, they are right. Sure, I could pitch in, get those Xerox & Warner ececs in their 3-piece Brooks Brothers suits to promise 8bit support if me & a few other people mortgaged our homes & our pension funds to save Tramiel & The Three Stooges. But once our money is in their pockets they will do do as they damn well please. This is how American business works, I've seen it once too often, I got a bad case of Attitude. Sunnyvale is 3,000 airline miles from Frazer, as far as I'm concerned that STILL puts Tramiel & Co. too close to AC! And if you think some newcomer will breeze in & change the mentality out there, guess again. Warner tried that when they hired James Morgan in 1983. And Tramiel in 1985. Face it, the place is a zoo. The only thing that changes are the animals Warner places on exhibit. The bigshot halfwits who call the shots out there will only manage to find another idiot to take charge. Only this time, they do it with money taken directly from the pockets of the users. But not THIS user.

Now, if you want to save some really USEFUL part of our developer market, cast your eyes to ICD. The amounts of money involved are much less, & the people involved are actually rational. I refer specifically to Tom Harker of ICD who called me out of the blue last Friday (June 4) to let me know rather emphatically that ICD is REALLY anxious to sever its ties to the 8bit market. He wants to sell the rights to all OSS/ICD products, along with all remaining supplies of parts & manuals. Apparently they still have a LOT of stuff, but all in pieces. How much money would it take? He indicated not less than $5000 nor more than $15000l. I see the problem there as not so much financial but rather one of logistical & technical resources. What would it take to buy them out? First, the money (which is negotiable within the above limits). 2nd, someone with lots of TIME on their hands (that's where I get off). 3rd, someone with a THOROUGH knowledge of both the 8bit machines & the 8bit market. 4th, somebody with a veery large garage ot similar type place where they could store all the stuff & set up a mini-factory to assemble & test the loose parts into saleable products. And 5th, the mechanical skills & business knowledge to do all the above. Tom prefers to sell this stuff to someone who will continue to develop & market it. The above requirements represent a tall order, but at least the situation is well-defined.

Any takers? Contact me or call ICD directly.

A final note. I'm dabbling in these waters myself. For the past month I've been negotiating with a "former" 8bit company to salvage one particular piece of software which has become essential to the operation of AC. I'm finding it slow going. Just composing an Agreement of Sale takes a bit of doing.

Forget Atari. I say, let us buy back our own damn market. Perhaps some sort of 8-bit Users Co-op or Consortium, whatever. Not just ICD, what about Innovative Concepts?

But before any of these pipedreams can come real, we must first get it into our heads that there are no free lunches.

So if you can put a sound chip in a cartridge like Ballblazer apparently did, can you put other things in a cartridge? Like, say, a fully functional 6502 and some better display hardware? If you could cram it all in there (or make a larger cartridge since part of it sticks out of the top anyway) you could have potentially created some games that blew away everything else available at that time. They'd cost quite a bit though...

I am just informed by our Publisher that, if all goes well, the June AC will get mailed out around June 11. Allowing time for the usual 3rd class pack mule express, it should start hitting mailboxes around the week of June 21.

The Classics Disk for June was sent out around May 28, most everyone should have it by now (mine arrived last Tuesday).

AC is on track. Feels good. And still growing!

Well it has been a long time since I have played with a tapedrive, but here is an idea. I think (no promises) that the tape drive places data on the magnetic medium using some sort of audible tone. If this is so, you could simply play the tape on a regular player, and at the same time record on another. By adjusting the volume, you may be able to recover the data (fortunately the tape drives baud rate is low enough not to create any HUGE errors).

On a similar topic, I just came into a bunch of tapes, but I dont have a tapedrive. Is it possible to make a SIMPLE interface betweeen the Atari and a regualar tape player?

Concerning the piracy issue, I would have to say "Yes."
I can remember seeing games that would have opening gambits bragging
about those who cracked them (I particularly remember "Glenn the 5200
man"). I don't believe (don't quote me) that it is illegal to copy
the cartridges to disk, it was just illegal to distribute the copies.
I once remember hearing about a program called Cart-Copy that did this
exact thing.

Hope this helps.....

1934. Bobterm Problem

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-09 01:22:04 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1993Jun9.012204.33049@austin.onu.edu>
Source record: 106490

I have experienced a glitch with Bobterm and I was wondering if anyone
else has ever had it. While Xmodem'ing files, and when the buffer fills,
Bobterm saves the info in the buffer. No Problem. But, sometimes a
packet or two will get transmitted during the save process. When
Bobterm returns to transferring, you see "Dup Block #", then "Bad Block".
After ten times, it aborts. This error is very unusual, though. It
only occurs while transferring certain files (usually .dcm), and it
does it at diferent places at different baud rates.

Examples: it will produce this error on the first save at 1200baud
it will produce this error after roughly 5-6 save at
9600 baud
Like I said, it is usually predictable with a .dcm file, and always happens
at the same places (it never does it at 300 baud). Is this a glitch on my
end, or is this a Bobterm bug. Please help

>On a similar topic, I just came into a bunch of tapes, but I dont have
>a tapedrive. Is it possible to make a SIMPLE interface betweeen the
>Atari and a regualar tape player?

Doable, yes. In ancient times, when I managed to scrape together
$400 for an Atari 400, I built my own tape drive interface for my
home stereo deck rather than purchase one. It worked, I still have
it, and I am glad I did. _But_ .. perhaps it was my design, perhaps
signal levels, interchangability with a regular Atari deck was iffy.
If I remember correctly, I could (usually) read my friend's tapes,
say with in excess of 80% success, but they seemed to only be able
to read mine about 50% of the time.

One thing important is that the Atari drive is a _stereo_ (sort of)
unit. They use one channel for data, the other was intended for a
sort of voice over/music accompnaiment ala the tape accompanying
a slide show. So you would have to use a stereo deck for the interface.

Another thing of slightly less importance is motor control. The Atari
started and stopped the deck under computer control, and timing could be
critical (more critical for bootable tapes). My unit interfaced
with my home deck that happened to have solenoid driven controls, and
a wired remote (not common at the time, more common nowadays). I also
had the service manual for it, and am not shy about modifying things,
I put in a separate relay for the Atari interface so I would not tie
up the wired remote.

Bottom line? My interface (which included RS-232 buffers to connect
to a PC, which I have not used as yet) cost something like $25 to build.
Not too mention time. (By the time it was in a box, with switches, lights
and labels). Buy a used Atari deck for $20 or less. I did. And
put my homebrew on the shelf.

I would say that they're pirated. If you want to play the games
legitimately you should probably get the carts and a 5200 to play them on.

If choose to pursue that route, it's time to head to
rec.games.video.classic.

In a recent article, somebody who didn't even sign his name, much less his Internet address, writes:

> ...Is it possible to make a SIMPLE interface betweeen the
>Atari and a regualar tape player?

This question came up here a couple of years ago. The concensus at that time was that it WAS possible, in theory anyway; I may even vaguely recall some former Atari engineer (NOT Steve Q.) popping up and talking about a nifty-neato prototype interface he'd built that Atari had declined to produce and market, etc., but THAT may have been part of a DIFFERENT thread.

Anyway, to interface a regular tape player to the Atari for playback would require a circuit to convert the audio tones on the tape into the appropriate high/low voltages for the SIO bus and serial I/O (does POKEY handle this?) chip. By all intelligent-sounding accounts, this was a simple circuit to build, but I don't have any idea how you'd go about it. How about it, hardware guys?

(My contribution to this, when it came up, since stores were still selling Atari XEGS's at the time, was to rig up a Walkman-to-Atari interface, write (or download) some kool demos, slip into the local retail outlet and sur-reptitiously install software from cassette. Can't you just see the people in the store wondering where the hell this stuff ws coming from? heheh! Never did get to do it though... darn it.)

I am just getting into an atari 130xe and drive and I a m wondering where software other than public domain can be had? Also since atari no longer supports 8bit, is the software by atari PD? Lastly, I know that 800 software is compatible with 130xe, but were there any games, word processors, etc. that were made eclusively to take advantage of the 130xe's 128k. If so please list any recommendations....

Thanks
Dave

Hell YES I realize it -- I was THERE and that's when I BOUGHT my first Atari.
Well, within two years of it anyway. I bought an Atari 800 with 48K memory
(that's 16K OS ROM plus 32K RAM) for $399, plus the "programmer's kit"
(Atari BASIC cart and manual, in a box the size of a Buick to make people
feel like they were really getting something for $29, a SS/SD Percom AT-88
disk drive for $309 (all this from the original receipt) and, as I recall,
an Atari 850 Interface Module for probably a couple hundred and a ProWriter
printer for about $500 and a (300 baud, acoustic-coupled) modem for another
hundred or so. I had about $1100 in the system when I got it all home,
and that's WITHOUT a TV or monitor! At the time it was the most money I'd
ever spent on anything, and I was all excited to brag to my best friend
who was always outspending me and trying to make me feel bad about it; but
when I told HIM I had just spent $1100 that day, it turned out HE had just
bought a CAR for TWICE that amount. Beat me again, the bastard... ;-)

No, you don't have to get a 5200 to be legal, but you would need to
get the legal cartridges. Once you've BOUGHT (not purchased a
license) the software, the company can't tell you how you can use it.
So if you have a legal copy, they can't complain if you use it in a
way that they didn't intend, such as store it on disk, modify it, and
play it on your 800 (or equivalent).

Of course, if the games are no longer being sold, then the moral
debate is a lot more complicated... (though the legal one isn't)

You want to see rip-off, check out the prices of the original IBM PC
of the same period. No monitor, no graphics card (without a card you
couldn't even get a text screen), no printer port (it was on a card too),
no disk drives, 64K of RAM, all for $2500+. Remember, this beast had a
cheesy speaker for sound, the best graphics were four color without a
changeable palette, you had to fool with DIP switches when you installed
more memory, the manuals were right out of the 1960s mainframe days, etc.
And people *bought* them!

> about it, hardware guys?

This idea is really old. I remember reading about it in an Atari
magazine from < 1986 about it. This article showed how to build an
interface like this.

In the former East Germany many 8-bit Atarians often couldn't
afford an original 1010 or a SX12. So the idea of an interface
between Atari and an ordinary tape player got really popular.

Some homebrew developments even offered more speed and more data
security than Atari's original equipement.
If you could find someone from that part of Germany, he'd be able
to tell you more about it.

I think the German/international ABBUC user club offers some
schematics for building this kind of interfaces (for members only).

Finally I know someone on my university who did this hack a long
time ago. He doesn't deal with the 8-bit anymore. I hope to convince
him to get on c.s.a.8. one day. Maybe he'll explain what he did.

I was wondering was happened to my brother's subscription. He paid the
$25 or $30 (whatever amount it was), and recieved only one issue, your
first. After that...nothing. Even after mailing a request for the status
of his subscription, he got no reply. He had been burned numerous times
by well intensioned Atarists, so he is no longer interested.

It is also a shame, since being a software developer for the 8-bit Ataris,
he get more disheartened each time he tries to keep up with the needs and
wants of the users and then gets dropped by the sources.

Sorry for using the net this way, but I thought it might prompt a responce
that would not come from a less public forum.

I have the following Atari 8-bit items for sale:

Hardware - 1020 color pen plotter/printer $10

Accessories - 1 Suncom Tac-3 joystick $3
1 WICO BOSS joystick $3
1 Atari 7800 joystick $3
1 set of paddles $5

Software on disk - Bank Street Music Writer $5
The Converter version 1.51 $5
Print Power $10
The Print Shop $15
RAMbrandt version 2.0 $10

Games on disk - Boulderdash Construction Set $10
Chessmaster 2000 $10
David's Midnight Magic $5
F-15 Strike Eagle $7
Hacker $7
Jawbreaker $5
Jewels of Darkness $5
Leaderboard Dual Pack $10
Master of the Lamps $7
MRCA Mach 2 $5
Pinball Construction Set $10
Quest of the Space Beagle (no docs) $3
Silicon Dreams $5
Trail Blazer $10

Books - Basic Atari BASIC $7
Mapping the Atari, revised version (includes XL stuff) $10
Atari DOS 2.5 Manual, $7

Magazines - ANALOG Computing issues 44(7/86), 45(8/86), 46(9/86), 49(12/86)
Antic: July, Aug/1985
Dec*/1987
Apr, Dec*/1988
* these issues include the disk

I also have over 50 ds/dd SpartaDOS formatted disks with
shareware/public domain/magazine software on them...

If you are interested in any of the above please contact me...

1961. 5200 conversions

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-09 22:14:30 UTC
From: phruby@ucrengr
Message-ID: <32464@galaxy.ucr.edu>
Source record: 106573

But Atari never wrote the games for the 8bits. They were for the 5200. The code is different than the version of the 5200. True Atari did write 95% of the code but don't the differences count? Isn't this alot like writing an exact duplicate for the Atari of a game that was only released for the C64? I don't think Atari holds any copyright for these games. They did not program them for the 8bits. Pieces of the code is not theirs. We don't know how extensively Glenn the 5200 man had to modify the original code. Hell, for all we know it could be 95% Glenn's code.

I have had a number of requests for these games. Most people said that they are pirated but want copies anyway. Can't someone come up with an argument for distributing these games? For example, Atari would have never made any money from these games because they never designed them for the 8bits. Besides, even if we do not consider them pirated, who in this case does it hurt? Atari stopped supporting the 8bits years ago. :-< Most, if not all, of the companies that designed software for the 8bits went bankrupt or moved on. Do you think Atari would release these games and all the official games for the 8bits to the public domain if we got a letter writing campain going? It worked for the Vetrex system. Somehow I would guess they would not as long as they have old 8bit carts in their warehouse but that does not mean the conversions couldn't.

I remember Analog Computing ran an article on transferring 5200 games to the 8bits. Actually, it was more of a differences article than a step by step process. Reading this someone could transfer the games over.

Jeff_Mcwilliams@abcd.houghton.mi.us (Jeff Mcwilliams) says:

>Has anyone out there made extensive use of local labels and assembly-time
>variables in MAC/65? I would like to hear from you if you have,
>I've been having some interesting experiences using this feature which
>are causing me a little distress.

I have heavily used .LOCAL variables in my Mac/65 code; Most frequently
used for looping_variables within one section of the code. I also
use it to seperate sections of code which do different functions. Extremely
useful when working within a shell 'package'. Although, you can not use
it for variables which you want to reference outside of the local.

```
ex:
.LOCAL
Selection
pla
cmp #1
bne ?SEL.TWO
JMP Routine_One
?SEL.TWO
cmp #2
bne ?SEL.THREE
JMP Routine_Two
?SEL.THREE
cmp #3
bne ?SEL.EXIT
JMP Routine_Three
?SEL.EXIT
RTS
.LOCAL
Routine_One
lda $cc
cmp #34
bne ?RO.ONE
sta misc
<blah> ;addition code etc...
<blah>
<blah>
?RO.ONE lda $cd
<blah>
.LOCAL
Routine_Two
```

Think you get the picture, as for assembly variables, not greatly used,
although I do remember using them at one point in time.

I'd heard that the 2600 was terrible to program, but I never dreamed it could be that bad!! :-) I have a new respect for some of the games I used to play on the 2600 (darn, I just gave away my 2600 and cartridges, I'd like to look at some of those games again in this new light :-)

The file tells a few things about the differences between the 2600 and the 7800, does anyone have any more info on the 7800?

Later,

From: brownan@vax.sonoma.edu
Message-ID: <1993Jun9.184555.1@vax.sonoma.edu>
Source record: 106576

I have a bunch of stuff for trade or sale.

I am looking for a color monitor with a speaker or
transkey
or xf551 and a 3.5drive with it
2400 baud modem
xep 80 with an 80 column word processor/ terminal program

in exchange I am willing to trade some or all of the following:

*Silent service
*Suncom Animation Station
Koala Pad and microillustrator cart
*Lightspeed c
*^star raiders x 2
^river raid
^centipede
^donkey kong
^asteroids
^missle command
^Galaxian
^caverns of mars
*diamond gos with mouse
*news station
*supra 300at modem
*1050 drive with dos stuff
*Flight Simulator 2
*Master of the lamps
*Microprint interface
*Autoduel
*Omnitrends Universe
ultima 4
a bunch of old electronic arts games(archon, racing destruction set,7 cities of gold,
bank street music writer, etc.)

* has manuals, and/or in original boxes
^ cartridges
some of this stuff doesnt have manuals.

I know what I am looking for is crazy but hey, these are crazy times.
If you want to buy some, make me an offer that I can't refuse.

let me know. contact me at 707-584-4702 or Brownan@vax.sonoma.edu or
brown@zippy.sonoma.edu

That's odd. A friend once plugged an Indus power supply into an Atari 810
and blew out the power supply. Has anyone actually tried to mix the two?

Dave,

There are several different interface cards that let you connect
standard SCSI drives to your 8 bit Atari. Again, the Black Box
I mentioned in a previous article is one of them, and probably the
best. The other two are the now discontinued MIO from ICD, Inc., and
the Supra Interface, now from K-Products.

British,

Okay, well I was programming MAC/65 and had about 5 different local areas of code. Everything was going fine, and then I added another .LOCAL section of code, and the compiler went nuts, saying all my .LOCAL variable references were undefined, and BEQ type jumps were bad as well. I was using Sparta 3.2d, and once this happened, I couldn't seem to find how to resolve the problem. I finally ended removing some of the .LOCAL sections, turning the local labels into global ones, until I got MAC/65 to compile properly. I then moved from 3.2d to Sparta-X. It is all very strange, and really ticked me off. The code consisted of a MAIN.M65 with includes to a 5K SUBS.M65 and 3K worth of MACROS.M65, which when finally assembled, resulted in about 1.2K of object code. Go figure. It really upset me, and I was hoping maybe somebody else had a similar experience, figured out exactly where the conflict was, and had any suggestions for successfully using .LOCALs a lot while avoiding the bug I ran into.

Jeff

> >

Don't forget that he founded Sente systems. The video
arcade game that was cartridge based. A good idea, but since he
didn't suck the toes of the big boys, was cold-shouldered out of
the picture.

This technology was A VERY GOOD IDEA. Before Sente, an
arcade owner would have to physically move machines around to keep
his game lineup fresh- to increase business. Sente would allow
the operator to simple use a key to remove the marqee glass, and a
key to open the cartridge slot to change the name and roms of the
game. Thus- a new game, without the need for moving machines
around.

I bought into this when it came out- but got burned
because the company failed. I liked the idea of having my
collection gal not only pick up the quarters, but also change the
games. I used to need a truck and TWO MEN to do this! Repairing
the machines was also simple, as there was ONLY ONE MOTHERBOARD
design to learn and once you saw a problem on one machine, it
would show up again on another. This does not work with
different manufacturers who use a different motherboard design
with each game! All in all he had a wonderful idea.....sq

(Does he still own Chuck E. Cheeses franchise, or did he sell
that? Bushnell is not a good businessman, but if I were him, I
would never sell that pizza chain.....)

Something that I have a had experience with is the possibility of a bad
power supply. After having my 800 XL for a couple of years, it began to
mysteriously lock up at unexplained times, but always after being on for a few
minutes. The power supply did eventually die on me and it was one of the early
"weak" versions -- the small, all black transformers -- probably helped
to its death by my memory upgrade. But since getting one of the newer, vented
versions (hey, it even matches the color scheme), I have had no problems.

Are you remembering to boot those games while holding down the OPTION
key? Many of the earlier games for the Atari do not detect if BASIC is active
or not, then either displaying the message "CARTRIDGE PRESENT" or locking up.
This will prevent the internal BASIC from loading.

BN> 850 help anything?
The 850 implements RS232 ports for the Atari 8-bit, allowing it to
communicate w/ non-standard (i.e. non-Atari) printers, modems, etc. It is
primarily hardware, but also has a handler which is loaded into the computer.
You could hook up your Atari to your Amiga w/ the 850 or ICD's P:R:Connection
via a null-modem cable, but you would probably also need some type of Telecomm
software for your Atari.

I've heard from several sources that Apple II's were frequently used,
at least by third party developers. I'm not sure what Atari used for
initial development. Lord Quest? In the mid to late eighties, Atari
switched to an ST-based system.

BTW, there used to be a commercially available 2600 development system
for the Atari 800. It fit into the cartridge port, believe it or not
(so the door wouldn't close; wonder how it got around that?).

The power supply for my Indus drive is:

Model DV-9319A
Output 11.5v DC / positive center

Trying to use a regular Atari 800/810 power supply just results in the
drive not even powering up, prob since that Atari supplys are AC 9v

Ive never tried my 5200 power supply... where is that...

In a previous article, dstuart@desire.wright.edu () says:

> I am just getting into an atari 130xe and drive and I a m wondering
>where software other than public domain can be had? Also since atari no
>longer supports 8bit, is the software by atari PD? Lastly, I know that
>800 software is compatible with 130xe, but were there any games, word
>processors, etc. that were made eclusively to take advantage of the 130xe's
>128k. If so please list any recommendations....

E-mail me for a copy of "All Known World-Wide 8-Bit Atari Vendors and
Developers."

Commercial software by Atari is not PD as far as I know, though apparently
it is in other countries.

Note: below addresses change from "currentm" to "mcurrent" any day now.

In a previous article, dstuart@desire.wright.edu () says:

> please excuse my utter ignorance in atari matters, but are carts
>from the 5200, 7800, xe game system, 800xl, all compatible with the
>130xe. If so then how do you adapt the 5200 & 7800 carts to fit the slot on
>the 130xe?

5200 - yes, if you copy the contents of the cart somehow. Not something I
know how to do.

7800 - no, completely different system.

XEGS, 800XL - yes, fully compatible

1983. Connecting an rgb monitor to a 65XE

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-10 15:02:44 UTC
From: svh@verdix.com
Message-ID: <svh.739724564@sarge>
Source record: 106592

Just picked up an RGB monitor for my 8-bit.

Anyone have the pinout for the monitor port handy? I have the tech
manual SOMEWHERE but haven't been able to lay my hands on it.

Thanks!
steve

I found this on rec.games.int-fiction.....

Article 3694 of rec.games.int-fiction:
>Newsgroups: rec.games.int-fiction
From: wuerdema@ibr.cs.tu-bs.de (Henning Wuerdemann)
Subject: Scott Adams for the Macintosh
Keywords: Adams, Macintosh
Date: Tue, 8 Jun 1993 08:31:24 GMT
Lines: 13

Someone posted me, that there are Macintosh versions of the adventures from
Scott Adams. He also said, that the person who owns the rights to the games
(Russ Wetmore) has given his permission for them to be distributed. I am very
interested in these games and want someone to post them to me or even better
to ftp.gmd.de, because i think there are more Mac User interested in(?).

****

Anyone know if these are PD for the 8 bit?

I bought a numer of them on cassette when they first came out and am
interested in finding out.

Steve

A to Z in San Jose CA still has a bunch of cassettes, new in box for
$7.50. This probably doesn't mean much to someone from Ohio, but Bruce
from B & C went in there Memorial Day & made a block purchase so you
should be seeing reconditioned drives, new cassettes, & trackballs at
good prices from B & C shortly.

You're confused. The carts for the 800xl and XE game system are compatible with the 130XE. The 5200 and 7800 are not compatible with anything but their own system. It takes a fair amount of hardware hacking to make a 5200 game run on the 8-bit computers.

Source record: 106521

I have beside my computer three breadboarded circuits I was playing with some time ago. One has an Exar XR2211 chip on it, another has an XR2206.

I know that one of the Exar chips is a PLL designed for use in decoding FSK, which is what the Atari uses to write its data at (as I recall) 600 baud. Before I bought my 1010 tape drive, I used one of the circuits to read data cassettes from my stereo deck. (After I bought my 1010, I discovered that it did a poor job of reading compared to this single-IC circuit.)

The other Exar chip is a "function generator" of sorts, which has a pin which will shift the generated frequency in a coherent fashion (thus, cleaner than the Atari method of switching between two independent frequencies).

Given that a half-duplex modem can do 1200 baud using FSK into a telephone line with its limited bandwidth, then 4800bps into one channel of a stereo cassette deck is certainly doable with this pair of chips.

But if the original poster simply wants to be able to write and read tapes in the Atari format, then the PLL FSK decoder chip (I *think* it's the 2211, but I'm not sure) is all that's needed - the Atari's built-in sound chip produces the tones for recording. When I bought the chips from Radio Shack (some years ago), the schematics were included.

The 2600 developer that I saw was hooked up thru the 4 joystick ports on the
800 and had a large adaptor that went into the 2600 cart slot...

There could have been a couple different ones... I don't know.
I have a picture of it in an old Electronic Games mag. from the early 80's
in the new products section.

I thought that it was cool but never could have afforded/found one. Kinda
like the keyboard they made for the 2600 and never released.

1998. 5200 ports

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-11 04:10:21 UTC
From: G44@delphi.com
Message-ID: <01GZ8D44OLRM90NC36@delphi.com>
Source record: 106604

It is my opinion that discussing the legality of 5200>8-bit conversions is pointless.
In today's climate, the company which made them is still teetering with doomsday, despite the "Falcon" and I really
think they are oblivious to it, and even if they found out wouldn't care.
The benefits to salvaging 5200 games for the 8-bits far outweigh the legal risk or ethical compromise.
I am not afraid of ATARI, nor should anyone else be, nor should they be a slave to perfect morality.

This is for Ben P.

I think I know what piece of software you are trying to get the rights to.
Since you did not mention it, I will not give it away, but the subject of my message
"DATABASE PROGRAM" might
supply enough of a hint for some.

If it is what I think it is, I have heard good things about it from Jeff, and with my
hardware configuration it
would be ideal.

I hope you succeed.

2000. Programmers Co-op

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-11 04:15:02 UTC
From: G44@delphi.com
Message-ID: <01GZ8D96799A90NC36@delphi.com>
Source record: 106507

I whole heartedly believe in a communal developers co-op.

Right now shareware developers are pretty isolated and do not share info with eachother much.

Such that important but daunting projects such as Unzippers or Zmodem never get done because the brain-pool is
isolated, not COMBINED.

Of the few but dedicated die-hards and programmers they should know eachother by name by now.

The dream street programs should be put on a "queue" and worked communally, because it is in ALL OUR INTERESTS for
us to fill some of the glaring gaps in our machines.

I started a SIG in Carina called the Developer's coop for just this purpose,
however, without networking attached files or something of that nature it will be hard to REALLY link up
projects.

But source code (text) and hints can still be shared via the net.

However, heretofore there have been NO programmers willing to step up to bat and talk about a project save my own
ramblings.

If I PUSHED for the net to expand and isolated some programmers perhaps I could set up a link so that they could
call locally and share info via the network.

That is about all I can do to fascilitate such a Co-op.

-Glenn Saunders
-g44@delphi.com

From: G44@delphi.com
Message-ID: <01GZ8DFEM1RO90NC36@delphi.com>
Source record: 106508

I'm afraid the "cheap" 8-bitter moniker is a really true thing.

You see, I am part of the Boston Computer Society and I will tell you, hardware wise, my stuff is
LIGHT YEARS ahead of everyone elses, and they are reactionary in their views on expansion, adding hardware, or new DOSs, et cetera...

And this is a real strong part of the userbase, that just sees hardware or elaborate software as "frills" or
unnecessary.

They are using stock 800XLs with 1 1050, talk about torture!

I mean, sure, back in 85 or something, okay, that was economical and sufficient.

But today 256K 800XLs are going for $50 and XFs for $75, hard drives for little over a buck a meg used.

To stick with SLOW and limited media is really quite stupid, because they can still have "power without the price"
AND make use of MODERN peripherals.

I mean, we can't accelerate the CPU, but I can sure as hell tell you all that once you work off a hard drive or
a huge ramdisk, you start thinking your machine has gotten a CPU speed increase of 300% since due to the memory limits
of the 8-bit, a lot of programs are VERY disk intensive, such that going to faster media makes EVERYTHING faster and
more convenient, and more powerful.

When dealing with people who just dabble, and already have 10 or more years worth of software collecting behind them,
it is hard to get them excited about ANYTHING. They still go to the meetings but they are just lukewarm to everything.
Show them the upper limit of 8-bit potential and they don't think it is anything to strive for, since they are just
dabblers.

It is very very hard to get people like that to BUY anything new.

Those are the cheapies!!!!!

And I have VERY little tolerance for them.

They would have a case whining about MIOs and hard drives back when the MIO came out, I mean, I was like that then.

I used to subscribe to ANTIC and ANALOG.

I read about the Black Box, the MIO, and I dreamt one day I'd have enough money to get a hard drive.

It was like science fiction to me.

But the prices dropped to the point where it was LUDICROUS to put up with enhanced density stock 1050s.

These people don't really keep up with things, and they are turning into the Dinosaurs our computers are often
classified as.

I mean, think about it.

486/66s for $1899 or so, package deals of course.

To me anything over a few hundred for a CPU is totally exorbidant!

I would never pay more than 200 or so for a new storage medium.

I was waiting for everying to drop down to bargain basement prices!

And hard drives ARE FINALLY HERE! Same for highspeed modems.

And LUCKILY, our machines can handle them, not so easy for commies!

To me, getting a hard drive or memory upgrade is not a freakish thing to do...

It is simply extending the "power without the price" philosophy to the NEW LOWER prices on TODAY's items that were
once UNATTAINABLE.

When things get really low it is TIME to pick it up.

Like take an Amiga 500, I saw one used in the paper for $150.

I am strongly thinking of getting it.

That is close to the price my XE was when I got it in 87, but it is a 7.xx mhz 512K machine with better graphics,
and more IBM emulation/powerful application potential, not to mention games.

I would never abandon the 8-bit, but even though jumping to an Amiga 500 isn't exactly jumping to the CUTTING EDGE
in computers, people have to REALIZE that we are dealing with a VERY VERY inexpensive option to get into
excellent games, solid throughput, and full 16-bit archetecture. It has been a LONG time since
a machine came down to this level and one can't ignore something like this.

I mean, when an ALPHA based computer comes down to $150 I doubt I will still be using ONLY 8-bit Atari's.

When someone offers you THE UNIVERSE you don't just stick with a planet.

People tend to lose sight of the fact that REALLY GOOD stuff gets TOSSED ASIDE and smart people should

PICK THEM UP, and form their own LATE upgrade path, late meaning while everyone is on 68000s, use a 6502, when everyone
is on 68040s, use a 68000, etc...

Because the Atari 8-bit HAS been at the AMIGA 500 level at this bargain basement status for YEARS now.

But then things JUMP forward and everything MOVES DOWN THE LINE.

I would never get an IBM system because they require special monitors and other TACKED ON items which jack up
even a BARE BONES 286 system, now or 10 years from now a 286 with a VGA monitor and junk will still be more than
an AMIGA 500 hooked up to a TV via RF or even through a 1080S.

I didn't want this to turn into a push for the AMIGA, I just wanted to say that the 8-bit community has a big problem
with "keeping our head in the sand" and we have to upgrade our machines to max out their potential in order to
VALIDATE still using them, and to simply KEEP UP with these things in light of the fact that stuff has come down to
AFFORDABLE prices.

I can validate using my system in 1993 because my MULTIPLEXed, floppy board system is impressive even to IBMophiles
in what it can do.

And it DOES come in handy, and the total cost was minimal compared to IBM comparable LANs and such.

But I can not, let's say, mentally defend using a 64K 800XL while Amiga 500s are out there with a significant
jump in features.

I feel comfortable with what I've got cuz I'm using the same kind of drives and modems IBMers use.

I get good throughput with these.

Such that it is rare that the CPU speed or memory limits call out to me as a PROBLEM.

So that I "FEEL" like I'm using an AMIGA 500 or 286 in many ways, since I can do MOST of the same work they do
at almost the same throughput.

But I could NEVER do this with stock equipment.

So I guess I feel for users, it is upgrade your Atari or jump platforms.

If you stick to stock equipment it is totally IRRATIONAL.

And those type of irrational people are the ones who are causing us so much problems (full circle!)

If they are happy with a 256K 800XL and an XF or happy or US doubled 1050, fine...

But a stock 800XL and stock 1050 is really a crippled system in today's world, and people should KNOW that they DO
have CHEAP CHEAP CHEAP options.

Everyone I meet is into the IBM fast track and are ditching 386s for 486s, I may sound like I'm pushing for the
same kind of thing, but I'm talking about a HUGELY different price scale in the monies involved.

Any rational being would realize that you can get 100 times the storage from a hard drive that costs
less than the 1050 cost when it came out!

Now THAT is power without the price!

2002. 5200 ports

Newsgroup: comp.sys.atari.8bit

From what I have seen, the response seems to be positive to distribute
these games. I wonder if any ftp site will take them though. a.a.u.e???
I'm not going to be the first to upload them.

2003. Atari 8-bit Spring Cleaning

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-11 05:29:41 UTC
From: andy@jarthur.claremont.edu
Message-ID: <C8Fz9H.D9A@news.claremont.edu>
Source record: 106510

```
It's spring cleaning time; time to clean out some of the stuff I
haven't used in a while. I have the following 8-bit Atari stuff for
sale:

Hardware:
Atari 800XL computer, with 256K RAM
Atari 400 computer. Some keys don't work, may be nonfunctional.
Magnavox RGB monitor
2 Indus GT disk drives
MPP-1150 parallel printer interface
CX85 Numeric Keypad, with drivers
Standard Atari joysticks
Atari paddles

Applications:
PaperClip
Print Shop (with many PD graphics collections)
HomePak
B/Graph
GT Estate Word Processor
GT Data Manager
GT Albert E. Spreadsheet
Aladdin Disk Publication - Volume 1.3a

Games:
Ultima IV
Omnitrend's Universe
Enchanter
The Hitchhiker's Guide to the Galaxy
Pinball Construction Set
Seven Card Stud/Cribbage
Galahad and the Holy Grail
Congo Bongo (Cartridge)
Centipede (Cartridge)
Super Breakout (Cartridge)
Demon Attack (Cartridge)

Educational:
Conversational Spanish (Cassette)
Number Blast (Cassette)
States and Capitals (Cassette)

Development/Utilities:
MAC/65 (Cartridge)
The MAC/65 Toolkit
Atari BASIC
```

SpartaDOS Construction Set
DOS XL
Graphic Shop

Books:
Mapping the Atari
Machine Language for Beginners
Compute!'s Second Book of Atari
Basic Fun with Graphics the Atari Way
The Elementary Atari
Atari BASIC, A Self-Teaching Guide
BASIC Computer Games
An Atari 8-bit Extra from ANALOG Computing

Also:
Lots of public domain software
Lots of blank floppies

I'd prefer to sell this as a bundle; best reasonable offer takes it.
I'll also consider offers on portions, although bundle offers take
precedence. Interested? Please send me mail at
andy@jarthur.claremont.edu...

No, you are not a total idiot, but you can't add a RamDisk to the buffer
memory in Bobterm. That would be nice though and there was talk that if Bob
ever released another version of Bobterm, it would be for expanded memory
machines. But to sort of answer your question, it is a lot quicker to
use the Ramdisk for u/l & d/l.

Gleen, I agree that hardware upgrades for the 8-bit are very affordable compared to prices of just a few years ago. However, to say that the stock 8-bit systems are "crippled" is an opinion that I do not agree with. Granted, it is not a powerful system when compared to a 68000 based system (which is kind of an apples vs. oranges comparison to begin with), but if that stock 8-bit system fills a particular users needs, then it is no more crippled than a 486 with a 250M hard drive used to develop C++ programs... it is all relative to the applications that the system is to be used for.

|> I whole heartedly believe in a communal developers co-op.
|>
|> Right now shareware developers are pretty isolated and do not share info with eachother much.

Starting about Dec. 1990, about four of us (Atari programmers) on GEnie joined to form the Atari Game Developer's Arena (AGDA), whose charter was to jointly develop new 8-bit game applications. Activity has been slow lately, and the amount of work to develop an interactive game turned out to be more than any of us realized. But we are committed to releasing our first effort shortly.

One thing we all learned: get all development done on the same assembler! We worked on two different, semi-compatible assembler programs, meaning that transferring work from one programmer to another meant a laborious re-editing process. This had to do with accepting upper/lower case text, format of operators and pseudo-ops, etc.

Stay tuned...

2009. Super Video 2.1XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-11 16:19:59 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9306111541.AA12186@smithkline.com>
Source record: 106517

Hello Peoples,

During my recent vacation my Editors took a break but my Alchemist was working his ass off. (I got all these different personalities inside, you know, they're all fighting to come out. I got Mr. Managing Editor, Mr. Circulation Editor, Mr. Professional Chemist, & THEN The 8-Bit Alchemist! Whew, it's crowded in here!)

Anyways, I managed to refine my Super Video 2.0 upgrade originally published in Current Notes (Sept./Oct 1991). The ultimate video improvement is now Super Video 2.1XL. I did the original work in an 800XL, it works GREAT. Then I transplanted it to a 600XL (& threw away the TV set!). The 600XL version is more work since Atari left the video circuitry unstuffed, but results are equally impressive to 800XL mod.

Following the gift of a 1200XL earlier this year courtesy of the infamous Robert Woolley, I'm now working up S-V 2.1 for the 1200XL. The 1200XL problem is turning out to be utterly fascinating & may force me to re-think all the Super video mods I've done so far. Reason: stock 1200XL video is the WORST of all the XL machines. How ANYONE can use a 1200XL without getting an eyestrain headache is beyond me. (Let us not even ask why Atari PRODUCED this video atrocity!) BUT... despite its crummy CV performance (which is easy to fix) the 1200XL in direct comparison with both stock & Super Video upgraded XL's & XE's exhibits SUPERIOR color saturation. I've been busy into the wee hours with oscilloscope & DVM & schematics, focusing my attention on this. If I am successful in my Alchemistic endeavors, S-V 2.1XL may be scrapped in favor of S-V 3.0XL, in which we will see not only the nice increase in picture sharpness given by S-V 2.1, but also at least an order of magnitude improvement in color saturation performance. The possibilities for you COLRVIEW & APACVIEW phreaks will be mind-boggling, you mono enthusiasts will have to settle for merely having a display as crisp & sharp as the XEP-80. And lawdy me, the possibilities for videogames... I can't even conceive it.

If all goes well over the summer you AC subscribers can look forward to a "video blowout" issue of AC in the fall, probably Oct. or Dec. Guys like Charles Cole, Jeff Potter, & Bob Woolley will be contributing some incredible articles.

Oh, damn, I'm so excited over this I just wet myself.....

I bought mine when they came out. A 400, 16k(the bigger option), 410, two
joysticks, Basic and of course Star Raiders. With taxes I dropped a little
over $1000 Canadian. No regrets though and its funny but the cartridge
costs have remained stable - S.R. Cart. was $69.99.
If anyone is interested I'd be willing to let it go at $900. (Canadian).

I was startled & distressed to see the post from Brett Bensely that his brother's sub seems to have fallen off the edge of the earth. Good heavens, the LAST thing AC needs is to lose someone, especially a paying customer.

Brett, PLEASE send me email giving me your brother's name/address etc. & if possibler the approximate date he sent in his subscription order. I'm not infallable & have run across at least 2 documented cases where I screwed up database entries.

Is your brother Bensely Consulting? Wracking my brains here.... I certainly did not receive ANY letter of complaint about it. I give subscription complaints TOP PRIORITY & make every effort to get things squared away ASAP.

There have been several instances where folks had a problem with their sub & I only heard about it incidentally thru 3rd parties. That's a little demoralizing as I try really hard to give good service. If I've somehow lost track of a paying customer that's something I take real serious.

Please contact me with details right away! I'm certainly most keen to get this straightened out!

2014. 1050 Drive problems

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-11 23:57:34 UTC
From: dstuart@desire.wright.edu
Message-ID: <1993Jun11.185734.10398@desire.wright.edu>
Source record: 106525

Thanks to everyone over the last few weeks with getting me
started in the 8-bit world. Anyway, I have more questions.....

I just gota 1050 drive for my 130xe system, but I dont have documentation
on it. Anyway, I can't get it to read. If I remember right, when you
turn on the drive initially, the "busy" light should come on, whether
or not a disk is in the drive. When I turn on my drive, nothing happens,
only the power light comes on, not the busy light. Any ideas?
I am pretty sure I have the drive addressed right (dips). Any help would
be appreciated.

The viewing of GIF's in CV mode directly would be a great feature,
because you always wonder exactly what the GIF will look like when converted
from APACview -- sometimes good, sometimes not so good, which can be
disappointing...

2016. ECI vs. PBI

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-12 05:40:29 UTC
From: ai792@cleveland.Freenet.Edu
Message-ID: <1vbq8d$kbq@usenet.INS.CWRU.Edu>
Source record: 106526

My question concerns the PBI (XL line -1200xl) and the ECI (130xe).
The articles I have state that one should/must use HCT type chips
if they wish to make/design any type of interface using the Parallel
Bus Interface, but just the other day a thought crossed my mind.
(It seems as of late, many thoughts have been floating around up there)
I know for the 130xe one needs to use both the CART and ECI to design
anything PBI-ish, and upon looking at several cartidges, I see that they
use LS type chips. Main question is: Does one still need to use the
low power high speed cmos-ttl bridge type chips [HCT] or does the ECI
provide for driving more chips than the PBI so using low power high speed
ttl chips [LS] work?

-BRiTiSH
ai792@po.cwru.edu

BTW:
I guess I'm looking for an answer from The Alchemist, or from one
of the few people who have been doing PBI hacking, McWilliams or Cortese.
(appologies for any mispellings/typos) And Ben, could you repost, in a msg,
your diagnoses why the MIO cable could only be 6 inches long?

Mr. Sabatino gave me Jody Lenn's address in reference to my
'article' about a PD 'archive' I have. Thank you. I see that
very little discussion was generated by my original 'article'.
So. Yes, everybody (experienced types) probably figure they've
seen most everything worthwhile for the 8-bit. I guess I'm not
really suggesting that all those programs be in the umich archive.
However, I spent months writing the DiskCat program and making
the catalogs. Someone might be interested in seeing the catalogs.
Say, if they are beginner and want some BASIC source code for
how to approach, say sound or graphics.

This sounds like your motor belt has slipped off. Take the cover
off the machine, and pull up (gently) on the actualy drive mechanism
(the big metal thingie :) and on the underside are two wheels, one LARGE
that's right under the spindle for the disk, and a small wheel for the
motor. There SHOULD be a black belt connecting the two. If they ARE
connected, spin the big wheel, see if the little one moves.

If there isn't a belt connecting the two, find it, it's probably
still in the case and put it on. I remember there being an
easy way to put the belt on, but it's been over 6 years since I've had
to do it, sorry...

Ben,

It went to manufacture that way NOT on the advice of the
engineers, but on the MANDATE of upper management to reduce costs.
The idea was, release it crummy but cheap- then immediately
provide a warranty fix (your video mod was done by Atari, appears
in service literature tho rarely used) to all those who
complained. I personally did NOT agree with this approach. It
was along about this time that nobody gave a damn anymore, and
things went down hill fast. The 800xl had incorporated
improvements- tho not much better in my opinion. Study how the
video was discretely processed in the 800/400 before going to the
modulator. Nice design!

sq

(and for all those of you who HATED the 5200 controller, you
should have seen the PROTOTYPE model! ....drool.... :)

If everyone is into SHOCK, let me tell you MY story. I
bought my first Atari when it just came out- to replace my
Commodore PET which got blown up by lightning. It was an 800 with
an 8k RAM cartridge in the package. I immediately bought three
16k carts at a price of (I believe) $150 each. I paid a whopping
$975 plus tax for the 8K computer. I then bought the basic
cartridge for about 80 something, and a cassette for I think 30 to
40 bucks. Later I could not live without disk drives, so I bought
two of them, at $500 or so apice. I think that is enough
remembering for one day. I remember plunking down over a thousand
DAY ONE just for the computer and 48k of memory..............sq

(but gawd, did I love that machine! I wore little holes in the
plastic where my hands rested upon the keyboard. By the way, I
still have that original machine. It is the OLD beige box, the
one that is all beige, no grey tint. Somewhere around '83 or so
they started making it look more grey, changing the color of the
plastic. One of these days I gotta get around to digging it back
out of the box, and maybe I can upload some original software to
the ftp site. I have a BUNCH of goodies- one nifty assembly
program appends a load title to a binary program. The load title
inits, then continues the load. What it does is puts a scrolling
message that you create upon any binary load program. When the
program is loaded, the title screen appears, and scrolls your
message. THAT one got abused locally- people putting titles on
titles on titles of pirate game files........)

2022. 5200 adaptor for XI/XE

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-13 06:27:44 UTC
From: phruby@ucrengr
Message-ID: <32675@galaxy.ucr.edu>
Source record: 106532

I wonder how difficult it would be to hack the 2600 adaptor for the 5200 to work on the 8bit computers. We all know the 5200 is just a 8bit computer without a keyboard plus some minor changes.

2023. 8bit for sale...

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-13 16:00:50 UTC
From: steelem@rintintin.Colorado.EDU
Message-ID: <1993Jun13.160050.27586@ucsu.Colorado.EDU>
Source record: 106536

I have the following 8bit stuff for sale:

130xe (case has yellowed over the years) - $40
1050 drive - $50
810 disk drive - $40

Any resonable offer accepted. First offer to meet posted prices wins.
Buyer pays shipping.

steelem@rintintin.colorado.edu

HCT? Hmmm.... Well opinions are like a..holes; everybody has one
& they all stink. That being said, here's mine <grin>.
The HCT just stands for (H)igh speed (C)MOS (T)ranslator or
something to that effect. The 8 bit has both LS & CMOS parts
already in it and was designed to work with both, but if you look
carefully at the schematic, none of the CMOS chips are running at
buss speed. IMO: This was 1/2 coincidental. I've also plugged
in the CMOS equivalent i.e. 74C158 in the motherboard W/O
problems. I've done stuff with 74LSxxx doing decoding on the
buss & have never had a problem. I really respect the abilities
of everyone who's done hacks on the buss, but sometimes I wonder.

74LSxxx does run significantly faster then CMOS, but for a 1.79
mHz clock it shouldn't matter *IF* you have a clean design.
Typical delays in CMOS are on the order of 20 nsec so if you
decode something like memory address with CMOS you'd better not
use more then a gate or two since the delays are additive & 40+
nsecs is probably enough to bust the bank. Standard LS stuff is
about 5X faster so it's hard for me to believe it wouldn't work
due to speed in any design. Figure *ALL* the Rambo & Newell
stuff is LS & works fine. Maybe if you bought cheap 1 mHz
[6520's, 6551's, 6532's] or something like that.

The only other problem I can think of is voltage <the
(T)ranslator part>. But it shouldn't be. I've never had
problems mixing CMOS & LS families. Logic levels for CMOS are
usually 0 & 5 for true/false with 2.5 as the switch point for an
input voltage. LS says 0 & 2.4 for voltage levels but this is
REALLY conservative. They always put out 0 & 3 to 4 volts which
means they can directly interface with CMOS logic levels. *Most*
LSI chips like the 65XX series are garanteed to recognize 2V as
good enough for a logic high so LS's 2.4v should be plenty good.

I wish I could go back & double check the need for HCT to find
out what the problem was but <sigh> no energy/no time. It would
only take a few part substitutions or maybe wiring in 10k pull up
resistors on the LS pins to find out why.

Another BIG posssibility are the diodes at CR16. I've fixed a dozen or so
drives where these thins have gone out. The solution Atari came up with
was to solder them 1/2 inch above the PC board.

[Quite Humorous, yet true... <Numerous amount of info deleted>]

>I wish I could go back & double check the need for HCT to find
>out what the problem was but <sigh> no energy/no time. It would
>only take a few part substitutions or maybe wiring in 10k pull up
>resistors on the LS pins to find out why.

The article I have on the PBI [Antic: Earl Rice series] only gives
the following eplaination: (Antic: March 1985 pg 69 Middle column)

The select logic bears some discussion. Because PBI timing requirments are
tight, we need to use fast logic chips to be sure things work. To make matters
worse, the PBI can electrically drive only one low power TTL load. When we
decode addresses, we'll either need to tie two gate inputs to some lines and
overload them, or put a low power buffer on the line and add an extra gate
delay to our circuit. Neither alternative is very attractive.
Fortunately, there is a logic family available that combines the loading
characteristics of CMOS with the speed of Schottky TTL. This combination of
speed with virtually no DC load on the PBI lines is just what we are looking
for. The logic family is the 74HCTxx series. . . . . .

Anyways, I'de like to know what sort of scheme you used to do the logic
decodeing if you've designed those RS232 ports via PBI, or anything else
frm the PBI for that matter.

Thanks,
BRiT

2029. Re: 5200 adaptor for Xl/XE

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-13 20:25:04 UTC
From: Bill.Marcum@launchpad.unc.edu
Message-ID: <1vg2f0$c21@samba.oit.unc.edu>
Source record: 106540

As I understand it, the 2600 adapter for the 5200 was essentially a complete 2600 machine that just used the 5200's power supply and video modulator. There were similar adapters for Colecovision and Intellivision (to play 2600 games on those systems, not vice versa).

2030. 2600 emulator for 5200>8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-13 21:32:41 UTC
From: G44@delphi.com
Message-ID: <01GZC61WU7C28ZFXOB@delphi.com>
Source record: 106541

That is an interesting idea, to use the 2600 plug in module for the 5200 as a "2600 gateway" kind of thing.
I think a 5200 cart>Atari 8-bit is doable.

The problem is, as far as I know, most of the 2600 emulators are not really emulators.

Like there is one for the Colecovision, and also the Intellivision I think, as well as the 5200.

What I think they are is actual 2600 components, a full motherboard sans video output or something.

In the 7800 instead of EMULATING the 2600 it switches to separate components on the motherboard to go into 2600 mode.

Because even by the time these emulators were appearing, the hardware in the 2600 was cheap enough that it was simpler
and cheaper to do this.

If you are looking for a way to program and beta-test 2600 games, then I don't think you can with the 5200 module.

Since, like I said, it isn't a 2 way street, just mainly a 2600 system which gets its power through the cart port of
the host system and sends video back to it.

If this is NOT how it works someone please correct me.

It would probably be more DIRECT to simply build an interface which would consist of one 8K or 16K EEPROM
that the ATARI can write to, and which also plugs into the 2600.

Or creating a PBI device which is a memory leach 2600 that addresses the ATARI 8-bit memory DIRECTLY as though
the internal ram of the XL/XE were a ROM cartridge for the 2600.

The PBI contains Direct Memory Access lines, which is how the 600XL plug in memory module works.

It is kind of a shame that noone made banked ram upgrades as PBI devices....

But anyway, like I said, it would be easier to work from scratch than to play arond with middle men like the
5200 module.

2031. Upgrade Options (and drive help)

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-13 21:33:25 UTC
From: Sean Michael Goller <wipeout+@CMU.EDU>
Message-ID: <4g6toZ600YUo05vklB@andrew.cmu.edu>
Source record: 106542

Ok, I've got an 800, a 130XE and two messed up drives (800 and 1050, but I'll talk about those in a minute). What sorts of accelerator/upgrade options do I have for either machine in terms of memory, speed, hooking on other peripherals (like me suprafax 14.4 at ANY speed ^_^) and whatnot? I looked in the FAQ and saw all sorts of names of upgrades, but nothing explanatory (perhaps should be added to FAQ?)of what they were exactly...

Now, about the drives: When I turn them on (either one), both power and busy light up, and drive starts spinning. However, they never stop. I asked about this a long time ago, and I was told it was a bad chip. Which chip, is it socketed (i.e. I can order a new one and replace it?) or should I say to hell with them and get new ones. Now, in either case, the FAQ mentions MYDOS, with all kinds of nifty features. Can I use MYDOS effectively with the 810/1050 such that I can take advantage of the ATARI<->MSDOS disk transport programs (since most require better disk formats)? If not, which kind of drive should I be searching for, and does anyone have any for sale? ^_^

Thanks! (Let's buy Atari and build a 65816-based one!)

Sean.

Someone whose message header Portal doesn't pull into this reply, and who doesn't sign his name/address to let me "fake it," writes:

>I'm afraid the "cheap" 8-bitter moniker is a really true thing.
> [...]
>They are using stock 800XLs with 1 1050, talk about torture!

Hmm, should I be insulted? I'm using a stock 800XL with 2 1050's, one of the latter with a US Doubler and the other with The Archiver. Not all THAT different from these folks you're deriding.

>I mean, sure, back in 85 or something, okay, that was economical and
>sufficient.
>
>But today 256K 800XLs are going for $50 and XFs for $75, hard drives for littl
e
> over a buck a meg used.

Unfortunately, the 'sync' between Atari 8-bit pricing and my own level of computer usage put me beyond the point where two floppies were sufficient, at a time when there WERE no options in the Atari 8-bit world. I had little choice but to "brand hop" to an Amiga -- on which I STILL didn't get a HD until just last year, and even then only a 10Meg, but whose floppies alone had ten times the capacity of those on the Atari 8-bit. I kept my Atari, but it is no longer my "primary" computer, and any money I lay out for peripherals will more likely go to the Amiga than to the Atari, although it would be untrue to say I will NEVER buy anything for my Atari again! Having said that, I find myself wondering whether MY reasoning is any-where close to that of YOUR friends. Is it?

>When dealing with people who just dabble, and already have 10 or more
>years worth of software collecting behind them, it is hard to get them
>excited about ANYTHING. They still go to the meetings but they are just
>lukewarm to everything.
>
>Show them the upper limit of 8-bit potential and they don't think it is
>anything to strive for, since they are just dabblers.

"Just dabblers," as opposed to WHAT? I observe that about 95% of the people who own computers (Atari 8-bit, or otherwise) don't use them for much of anything "serious," whatever THAT means; many of them almost never even POWER UP their computers, and even then are about a hundred times more likely to be found playing a game than developing software, doing business projections, or accessing the Internet. I myself do all of the latter (well, not many business projections, I guess), but by your lights I would have to classify myself as a "dabbler" nonetheless. You sound not unlike

an "intellectual snob," and I wonder just what pursuits you consider to be MORE than "just dabbling?"

When I went to Atari user group meetings, I was bored stiff by the combination of by-the-book Rules Of Order proceedings, and rehashing of newbie material ("how to write a simple BASIC program," etc.). The annual used-equipment auction was worth attending, and about once a year there'd also be sufficient technical content to justify the gas money for the 3-mile trip to the meeting, but for the most part, no. This newsgroup is a hundred times more interesting, involving, and intellectually stimulating than any user-group meeting I've ever attended or heard a firsthand report of, plus I can log in here at MY convenience, not someone else's, and don't have to leave the house to do it.

>It is very very hard to get people like that to BUY anything new.
>
>Those are the cheapies!!!!!
>
>And I have VERY little tolerance for them.
>
>They would have a case whining about MIOs and hard drives back when the MIO ca
m
>e out, I mean, I was like that then.
>But the prices dropped to the point where it was LUDICROUS to put up with enha
n
>ced density stock 1050s.

I have rarely, if ever, been willing to spend the prices asked by ANYONE for ANYTHING: in my 1930s-based (from my parents, who lived through the Depression and chewed me out EVERY time I spent ANY money for ANYthing) sense of "what a thing is worth," 99% of everything, new OR used, is way overpriced, and I won't buy it. (And yes, it DID nearly kill me to buy a car, a house, etc.!) Even if HDs are "$1 a megabyte" -- and I've NEVER seen a price like that; where'd YOU allegedly see it? -- my reaction is, "that's nice, but it's still too much." MAYBE I'll start to be interested when the price drops to 30% of that. Maybe. This outlook has kept me from doing a lot of "fun" things I would have liked to do but could never afford. Most specifically, back in the days when a state-of-the-art BBS could have been run with two floppies and an 800XL at 1200 baud, all I had was an 800 with ONE floppy and a 300 baud modem, and I couldn't justify the additional drive and new modem -- not to mention a dedicated phone line. About the time I became able to justify/afford a second floppy drive and 1200 baud modem, the rest of the world moved up to 2400 baud and HDs. By the time I got a 2400-baud modem and improved the capacity of my floppies, they were using 9600 baud and HUGE HDs. And so it goes. Ten years after something becomes obsolete it will become "reasonably priced" in my book.

(Incidentally, at the moment it would be a LOT of fun to have an Amiga 1200 or 4000 to replace my highly-obsolete 1000, but natch I can't afford either of them. By the time I CAN, they will themselves be obsolete, and

something unaffordable to me at THAT time will be the new gotta-have system. Beats the HELL out of me how the scads of Euro teens on c.s.amiga can afford the Amiga 3000's, 4000's, etc. THEY all seem to have.

>These people don't really keep up with things, and they are turning into the D
i
>nosaurs our computers are often
>classified as.

I retain, and still use, my Atari 8-bit system for reasons some would call "sentimental" or "religious:" I love having a computer which I can comprehend in its ENTIRETY, and program easily (something I cannot say about any of the other computers to which I currently, or expect in the future to, have access: the VAX/VMS system I use at work, the *NIX workstations that are taking over the world, nor even the Amiga on which I am typing this. Secondly, I have put a lot of time and effort into undertanding, writing and gathering software for the Atari, and feel that I have put a lot of MYSELF into it, an investment I cannot easily discard.

>I mean, think about it.
>
>486/66s for $1899 or so, package deals of course.
>
>To me anything over a few hundred for a CPU is totally exorbidant!

Whereas to ME, anything even remotely approaching the SAME NUMBER OF DIGITS as "a few hundred," for a CPU, is totally exorbiTant. People who are willing to spend "a few hundred for a CPU," always find that, lo and behold, CPUs cost "a few hundred!" That's because the industry -- ANY industry! -- will charge "whatever the market will bear," and have observed that you and yours are willing to bear quite a bit -- quite a bit MORE than -I- would, that's for sure. But it's a free country (if you're in the US, anyway ;-)); do what you want. But don't you DARE chew ME out for not wasting MY money on things YOU are partly responsible for the exorbitant pricing of!

>I would never pay more than 200 or so for a new storage medium.

It's obvious to ME that YOU do not know the value of a dollar. Who buys you your toys? Mom and Dad?

>I was waiting for everying to drop down to bargain basement prices!
>
>And hard drives ARE FINALLY HERE! Same for highspeed modems.

I would hardly call "a couple of hundred" "bargain basement prices!"
You are a fool.

>It is simply extending the "power without the price" philosophy to the NEW
>LOWER prices on TODAY's items that were
>once UNATTAINABLE.

The prices may be LOWER, but they're not LOW. Everything is relative, but what's CHEAP to YOU is not cheap to EVERYBODY.

>I mean, when an ALPHA based computer comes down to $150 I doubt I will still b
e
>using ONLY 8-bit Atari's.

The only thing that would make an ALPHA based computer such a bargain at
$150, would be that it ORIGINALLY cost a LOT MORE than that. If all work-
stations sold for $150 right out of the box, $150 for an ALPHA would not be
a big deal, nor even a bargain. Simple economics.

>PICK THEM UP, and form their own LATE upgrade path, late meaning while everyon
e
> is on 68000s, use a 6502, when everyone
>is on 68040s, use a 68000, etc...

Hmmm... now all of a sudden you sound like you're making sense. I *never*
go for the newest, latest, mass-popularity system, because it's too expensive.
Perhaps you and I are not so different after all, but differ only in our
estimation of WHEN something's price has fallen enough to be "worth buying."
You'll buy at "a couple of hundred," whereas I'll only pay "a couple of dozen,"

dollars.

>I didn't want this to turn into a push for the AMIGA, I just wanted to say tha
t
> the 8-bit community has a big problem
>with "keeping our head in the sand" and we have to upgrade our machines to max

>out their potential in order to
>VALIDATE still using them, and to simply KEEP UP with these things in light of

>the fact that stuff has come down to
>AFFORDABLE prices.

Well, maybe. On the other hand, you seem to have a lot of money to throw
around, whereas I for one do NOT. A lot of the people reading this are in
way tighter money situations than I am, too. So forgive 'em if they don't
run right out and "max out" their Atari 8-bit systems.

>And it DOES come in handy, and the total cost was minimal compared to IBM comp
a
>rable LANs and such.

True. But most people don't need/want/know-what-to-do-with IBMs and LANs and
such, and would never have considered those things in the first place.

>But I can not, let's say, mentally defend using a 64K 800XL while Amiga 500s a
r
>e out there with a significant
>jump in features.

Exactly the reason I don't max out my 800XL with a Black Box, Multiplexor,
etc.

>So I guess I feel for users, it is upgrade your Atari or jump platforms.

Absolutely true, IF you're NOT SATISFIED with the performance of your stock Atari! As it happens, I AM satisfied, BECAUSE I jumped platforms but ALSO kept my Atari 8-bit. It IS possible to do BOTH, you know!

>If you stick to stock equipment it is totally IRRATIONAL.

No, it's not. My Mom has a stock 800XL that she NEVER USES. Would it be rational for her to upgrade it? She MIGHT use a PC with, say, Word-Perfect -- or she might not. Either way it's a lot of money to blow on a "let's find out" longshot. If YOU would care to donate, I will be quite happy to accept funding.

>Everyone I meet is into the IBM fast track and are ditching 386s for 486s, I m
a
>y sound like I'm pushing for the
>same kind of thing, but I'm talking about a HUGELY different price scale in th
e
> monies involved.

The price scale is hugely different, true, but NEITHER price scale is "cheap" for EVERYBODY.

>Any rational being would realize that you can get 100 times the storage from a

>hard drive that costs
>less than the 1050 cost when it came out!

But NOT from a HD that costs less than the 1050 costs TODAY. Probably because, as far as I know, there ARE NONE...

>Now THAT is power without the price!
Power with a SMALLER price. "WITHOUT the price," would be "we're giving it away FREE!" Or, figuring in postage/gas mileage, "we're paying people to take it away!"

I need some help. I need to replace my atari 7800 proline controlers.
I've been watching they die and this is about that. I wonder if some
kind soul could tell me how to hack a genesis controller to be a
proline contoller. I use my genesis controlers for my genesis, my 800xl,
my 2600 and for the few games of the 7800 that didn't require the prolines.
I'm willing to here other suggestions if there are any,

Rob Merritt

In a previous article, ai792@cleveland.Freenet.Edu (Tony Lang) says:

>
> My question concerns the PBI (XL line -1200xl) and the ECI (130xe).
>The articles I have state that one should/must use HCT type chips
>if they wish to make/design any type of interface using the Parallel
>Bus Interface, but just the other day a thought crossed my mind.
>(It seems as of late, many thoughts have been floating around up there)
>I know for the 130xe one needs to use both the CART and ECI to design
>anything PBI-ish, and upon looking at several cartidges, I see that they
>use LS type chips. Main question is: Does one still need to use the
>low power high speed cmos-ttl bridge type chips [HCT] or does the ECI
>provide for driving more chips than the PBI so using low power high speed
>ttl chips [LS] work?

Tony,

Well, HCT chips offer a really low propagation delay without consuming
too much power. Perhaps the designs you were looking at didn't have
separate power supplies? That might explain the designers need to
minimize power consumption. 74F series would actually be better, since
they are faster, but I'd have to go back and look through my data books
to see about other issues: line capacitance, line loading,
noise and ESD immunity, that stuff. If you are worried about
the PBI or ECI/CART having a limited drive capability,
Analog Magazine had an excellent schematic showing how to put
two 8 bit bus drivers on the Address BUS, and a OCTAL BUS Transceiver
on the databus. That would solve most problems, if you were to say,
plus a card directly into expansion port, with the
driver/transceiver chips really close to the connector.
Consideration would probably also be given to the Clock, EXTENB
(external enable), and MPD (math pack disable) lines. At least the
clock should be buffered or otherwise cleaned up. Cable problems
have to do with not capacitance, but inductance of most cable.
Ben's has begun to have success with 50 pin TWISTED PAIR ribbon cable.
If you could use round, shielded, twisted pair cable, that would
somehow plug directly onto the PBI via a 50 pin card edge connector,
or the dual CARD EDGES you need for the 130XE, that might be even
better.

Chris has a point.

But I can see where the originating Author is coming from.
I myself read a lot of PC Magazine, Computer Shopper, and spend
time on Unix workstations, NeXT Work stations, and even an IBM
Mainframe up until a month ago. It's easy to get caught up in all the
"high Tech" bells and whistles people are throwing around these days.
As for 386 486 machines, man, just reading PC magazines gets you
bombarded with PROPAGANDA. Look at your average home computer user.
They're not using multimedia, and multitasking and networking and stuff.
Sure, there is the high end crowd that does this, but there are others
who maybe run something like Quicken to balance their checkbook,
maybe write some letters and figure their home mortgages, let the kiddies
play some games, and connect to an online information service or BBS.
When you see so much propaganda, it's easy to start thinking that
everybody and their brother have these monstrous CPU monsters, and they
all are doing wild, SCI FI arcane things on them. Yeah, I know
lots of people with 600 DPI HP LaserJet 4's, Dye Sublimation printers,
24 bit color image scanners, OS 2.1 or Windows NT. I mean, what's
the average joe gonna use that stuff for?

I still use my 8 bit mostly for occasional letters, and connecting
to the Internet to read mail. Nothing fancy needed there, just an
honest word processor and a decent term. program. 1.79 mHz
and a Black Box and even a 14.4K buad modem would still keep pace with
my needs. But I also program, and I'm an Electrical Engineering
student. So for those activities my needs change a little.
The less time I have to wait for MAC/65 to link 7 different .M65
files and then assemble them, the better. So yeah, a RAMDISK
or a hard drive would be handy. But programmers are rare.
Sure would be nice to create 300 DPI or even 180DPI schematic images
on my 8 bit. Working on it... someday we'll do that. But only
a few people do hardware hacks, or need to draw schematics.
Those people can worry about hard drives, memory, and CPU upgrades.
Regular folks don't need that stuff.

As a programmer, I sometimes find myself thinking the way Chris described.
As a high tech elitist snop type. I mean, who do these lowlife people
think they are, thinking 64K and a 1050 drive is still viable?
Well, if all you do is balance a check book and write people letters,
maybe that's all you need.
Hey, it would be great to think that every home should have an
800XL with 1 meg, a Black Box with a laser printer and a 128 meg
drive, and serve as host to a multiplexor. Sure, then Mom has a
networked 130XE that she does the checkbook and grocery lists on,

Heather has a color 128K 600XL with Gumby stereo that she plays
educational games on, and Dad uses the main system to do the
Church newsletter, and check the stock quotes on Genie or Dow Jones.
Yeah, and we all have Homes with white picket fences, a dog and a cat,
and 1 and a half kids.

Talking about the Atari 2600,
I have seen machines lately, which looked like a 2600, and had
some hundred (I never counted, but there were many) games built in.
So many of these machines were around, but no cartridges.
Sounds like a "dream machine" for those old days. :-)
This happened in Budapest, Hungary.
Has anybody seen them also?

Jeff,

lately I've tried some experiments with those drivers (74LS244) and
the transceivers (74LS245). There's one aspect about it
which is confusing me. While I don't have any problems with the
LOW output level, which is 0.19 Volts, I don't understand why the
HI level wouldn't go above 3.8 Volts.
It's sort of bad, isn't it?
I've measured the output levels of the computer and they seem to be
around 4.95 Volts! Now, when I connect this 74LS245 transciever
I'll get only 3.8 Volts on the other end.
This is no good at all. With this low voltage I can't allow to much
interference on the lines.
What's wrong with my LS ICs? Can other technologies like F or HCT
pull up the HI-level a little bit?
If not, maybe a puul up resitor could help?

I don't think it could be a broken belt (as suggested in a previous post), because he said that the busy light never came on. Even if the belt is off, I believe that the busy light will light as long as the drive motor is OK.

I had a 1050 go out years ago, and it was one of the diodes (don't know which). It caused the drive motor to spin intermittently, and then not at all.

Marek,

Hmm, according to the National Semi. 2.0 volts is considered a high
on an input, and with a MINIMUM VCC, High outputs range from
2.0 to 2.5 volts. Now I'm looking at 74F data, where
output LOW voltages are 0.5 volts typical.

Here's some data from a Motorola High speed CMOS book:

LS TTL input low voltage: .8
input high voltage 2.0
output V high (min) 2.7
output V low (max) .5
HC input low voltage 1.0 (max)
input high voltage 3.5 (min)
output high (min) Vcc-.1
output low (max) .1

H-Cmos input threshholds depend on operating voltage VCC to GND.
H-CMOS according to Motorola are rated at 2 to 6 volts.

So I guess you could say that TTL levels are really sloppy, which is why
HCMOS has such a better noise immunity rating. The clear choice would
be to use HCT devices to go from TTL to CMOS levels, and then use
HC in the rest of your circuit to maximize noise immunity and minimize
power dissipation. But if you say the PBI outputs are already in the
4.85 v range, go with High Speed Cmos. They're as fast as LS, and should

provide crisper output levels than your TTL gates. I should really
get a handful of each and experiment myself.

With the exception of Larry Richardson's Amiga-boosting, I'd like to add my endorsement to everything else in Larry's post.

That post sounded like something that might have come from AC's Hardware Editor, Charles Cole (who incidentally has an article in the June AC on using 9600-Bd modems with the 8bit).

AC's various Columnists have been banging away at the theme of Larry's post from the beginning. Mikr Jewison is in dirt-cheap RAM upgrades, Jeff McWilliams is into describing how XE-banked RAM works & how to use it effectively, & of course good 'ole Dave Richardson has been showing us how to use DD-3 as a fairly effective substitute for the fancy DTP packages on the expensive machines at a ridiculous fraction of the cost.

In the June AC I describe my own system I use to run the magazine, which is even more souped-up than Larry's. And I too own a 12-MHz/3-meg 286 (it lives in the closet with my 1040STe).

I frequently have discussions with other AC Editors that involve comments about how backward most of our community is when it comes to installing a CHEAP upgrades that can improve their productivity out of all proportion to the cost of the upgrade. People recoil at the thought of spending $200 for a Black Box plus another $100-$150 for a 2nd-hand hard drive (JBT sells them, check out Computer Shopper!), to stick onto the XL they paid $50 for. Oh no, they'd rather run out & plunk down $1100 for a 386. It's one of the MANY incongruities I've discovered about our user community since I got into AC. People see these ads for cheap IBMs & get sucked in, only to discover there are many hidden costs like cables & software. Having invested that much up front, they can't go back, it's an ego thing, human nature etc.

This morning I dumped 23 pieces of AC-related correspondence off at the post office on my way to work. Among those was a reply to a recent subscriber inquiring asking where was the June AC (it's in the mail) & also expressing the opinion that 8-bitters were "hobbyists". I fairly bristle at the word, & most of my reply to him consisted of how useful my 8-bit is to m & how I employ it to do 90% of the things I use more expensive machines for, at a mere fraction of the cost. I'm of a mind to print this guy's letter- & my reply- in the August AC.

Another example. Couple weeks ago a reader in Loiusiana calls me up, wants to know how to hook up a Centronics printer to his 8bit. I tell him about various interfaces available. He asks if the custom printer driver software comes with the interface. No, I say, the printer driver is specific to your software. I ask him what wordprocessor does he use. A pause, then he says he doesn't have one, tho he has mentioned in the conversation any number of PD programs with docs-on-disk. My brain convulses. How the hell you print? I ask. Oh, I do

all my printing from DOS 2.0 he says, but sometimes it doesn't come out too good. It's all I can do to stifle a primal scream as I explain wordprocessors to this guy & exhort him to spend $20 to buy AtariWriter or TextPro or 1st Xlent or something. AAARRRRRRRRRRGGGGGHHHHH!!!!!!!

I get people calling me long-distance to tell me how great their 800 with 810 SS/SD drive/DOS 2 & 830 300-bd acoustic modem is. Of course I'm polite to these folks, but I'm biting my lip the whole time, waiting an opportunity to suggest something a little more up-to-date. It kills me.

The issue of using our old machines productively is one that will remain important to AC, despite occasional complaints I'm getting from beginners that this stuff is over their heads. (But even the beginners will have their champion in AC when I finish hiring our Resource Editor this month). Pushing the envelope in technology- both hardware & software- & telling users how the newer tecnology can be effectively applied- is one of the mainstay themes underpinning every issue of AC.

Hi. I didn't know exactly where to post this, because I only
have limited information about what I supposed to be asking. Anyway,
I was wondering if someone had a brief list of disk access commands
(directory listing, loading, saving, that sort of thing) for atari
computers. I have a friend who picked up a couple of computers,
printer, disk drives, modem, and about 100 disks for around $30!
Anyway, the problem is that the stuff didn't have any manuals to it,
and so he doesn't really know how to use any of it. I don't remember
exactly what the computers are...I think one is an 800 something or
other. Anyway, if someone could e-mail me some helpful commands,
I would greatly appreciate it. About all we're really interested in
right now is disk access commands, but if you had anything else helpful,
that'd be cool too! Thanks in advance.

This is for Brett Bensley.

Mark's missing mags went out in the mail Saturday morning, June 12. The June issue will follow along in a couple weeks. The missing issues are accompanied by a 2-page letter of explanation & apology.

I drove home from work Friday nite wondering how the hell could I lose somebody like that. Subscription processing is a process I have reduced to an exact science, I have it down cold. All the bugs in the system have been discovered (rather brutally, I might say) & either eliminated or neutralized. For a paid subscriber to vanish off the face of the earth was incomprehensible to me.

I did wait for a reply from Brett but rather went to work on the problem as soon as I got home. It took me a couple hours of digging to piece it all together. Man, the hand of Murphy was clearly evident here. A classic case of human quirks mixed with flawed technology. Suffice it to say the situation is now well in hand, with Murphy barriers suitably installed.

This Murphy guy is wise to stay in hiding, I think he knows what's waiting for him if he ever presents his ugly puss to me in person. I know a bony-fingered Alchemist who's just ITCHING to lay bare hands on Murphy & rip his rotten flesh to pieces.

And you subscribers to AC, know that I am ON YOUR SIDE. Remember, I'm one of Yooze Guys. I know how painful it is to wait two whole months for a magazine, & then it doesn't come. Devastating. I, too, am a paid subscriber to AC. Anyone who has shelled out their $25 deserves every issue they've paid for, & I'm here to see to it you get your money's worth.

But you gotta tell me. Wait a good month before you send an inquiry (to allow time for the post office to send your magazine by way of China), & then drop me a 19-cent postcard. Cheap. Or send me Internet mail. (You can also send me GEnie mail, but I only log onto GEnie every 2-3 weeks: B.POEHLAND). Be assured that I take ALL such inquiries VERY SERIOUSLY. I've even startled a few readers by calling them personally in the evening to follow up on a problem.

If AC fails, it will fail on its own merits, not due to something stupid like sloppy subscription service. Not as long as I have something to say about it...

The bipolar TTL families (LS, S, F, ALS, etc.) only drive up to 3/3.5V
for Logic 1 (Voh as it's called). Nothing wrong with them, just the
nature of their outputs. The noise immunity isn't as good as if it
swung 0 - 5V, but you probably don't need that. A pullup resistor
(say 1K to +5V) will allow it to swing to 5V. The CMOS families (C,
HC, HCT, FCT, AC, ACT) will swing rail-to-rail, unless heavily loaded.
The ones without a "T" in the prefix (HC, AC) won't (by the book)
accept the TTL levels as inputs (in practice they will, usually). This
provides greater noise immunity on Logic 1 signals.

In a previous article, cd827@cleveland.Freenet.Edu (Jeffrey J. McWilliams) says:
>
>Tony,
>
>Well, HCT chips offer a really low propagation delay without consuming
>too much power. Perhaps the designs you were looking at didn't have
>separate power supplies? That might explain the designers need to
That might be it. Lemme dig it out. Hmm, the parts list only lists the
chips and crystals needed, yet no seperate power supply. So that might
be it. So if one does provide their own +5 volts power supply which chips
would you (or anyone experienced) would recommend? the 74F series?
My little Computer HardWare book has this little comparison table:
IC Propagation Supply current
Delay time (ns) static @ 0.1 MHZ
4011(CMOS) 50 .01uA .08mA
74C00 50 .01uA .08mA
74HC00 8 20 uA .14mA
7400[TTL] 13 3 mA SAME for all TTL Chips
74LS00 7 2.4mA
74S00(Schottky) 4 20 mA
74ALS00 7 1.5mA
74F00 3.7 7 mA

Also another question I have, and asked before is:
How do you compensate on the 130XE for a LACK OF a EXTENB signal?
Do you just do your own address decodeing and drive the EXTSEL
signal as normal, along with the MPD. ?

Source record: 106412

Something that I have wondered about but never seemed to get any answer to has to do with the serial port and disk access on the 8-bit.

I realize that the 850 was set up to use the serial port on the computer in such a manner that the PIA (?) acts as a UART. This neccessitates putting the R: device on hold in order to use the serial port for something else such as disk access or printing.

If one is using the Parallel Interface Bus for a hard drive, is it possible to keep the serial port active? I have seen no software that takes advantage of this, so I am wondering if it is possible. It would seem that if you use an MIO or Black Box which have serial ports, printer ports, and hd ports on them that you could keep the serial port open while doing disk access thus facilitating the use of streaming protocols like Z-Modem. If this is possible, could someone tell me how?

My particular setup consists of a K-P hd interface (old Supra) and a P:R: connection.

From: mat@unh.edu
Message-ID: <MAT.93Jun14204820@metro.unh.edu>
Source record: 106417

I finished up the modifications for the 800 256k ram card hack.
And the memory card worded fine at this point, as 16k and worked
correctly with the basic program to test the bank switching of
the ram...

I then did the AXLON mod to make it compatible with the AXLON
cards for the 800. I was told that with the memory card with
way it would work with MYDOS (I have 4.50), but I crash every
time I try to configure it.. There wasn't any instructions on
how to configure the ram disk with MYDOS I assumed it was in
'O' (I think)...

Has anyone does this mod or know how to use an AXLON ram card
with MYDOS??

Thanks, Mike

From: G44@delphi.com
Message-ID: <01GZDN7U6XAA8Y6KV0@delphi.com>
Source record: 106415

Well, I feel I should partially apologize for my post "blasting" users of stock 8-bit systems.

I DID fail to mention that a sizable portion of 8-bit users, which include some of my BCS colleagues, are
8-bitters in as much as being part of a club, but who's REAL computer is an IBM or something.

To users who have upgraded to a different platform, justifying additional money towards the 8-bit is difficult.

I have found a direct correllation, however, between a lack of Atari 8-bit hardware, and a lack of knowledge about
newer software.

This is because the 8-bit userbase is SO isolated, that the modeming userbase tends to have the better hardware.

This creates a vicious cycle, and feuls the notion to these people that the ATARI has totally stagnated for many years.

This was one of the reasons I got my BBS up and running.

I was out there picking up the new files and I felt people should see them instead of thinking
that the newest program to come out for the Atari was Star Raiders.

For those who are a part of this newsgrop with only 1 810 or 1050, and the 8-bit is your ONLY system, all I can
say is you don't know what you are missing!

Sure, it isn't NECESSARY to upgrade your storage, but it sure as hell helps you be more productive.

I mean, being able to save off a document in a matter of seconds and not have to worry about a pile of disks
tumbling all over the place.

You know, people have to realize I was just like that, I was stuck with just a 130XE and a stock 1050 for several
years.

If the ATARI had never been as affordable as it was in the mid 80s I would not have been able to purchase a computer.

But to me, a buck a meg is not too much to pay for a hard drive.

To me, the one time expense of a hard disk interface and a cheap hard drive, (some go for as little as $50, the

going rate of a used 1050!) is in tune with the monetary capacity of most 8-bitters.

Perhaps not ALL, but to them, I'm sure they would WANT something better, faster, more convenient.

For people to foolishly, let's say, go out and buy 2 more 1050s when they could jump up geometrically with
even a SMALL hard drive.

To people realize how many 64K files can fit into 20 megs even?????????

You take a 1050 and a 20 meg hard drive side by side.

The difference is ENORMOUS!

I just think if you want to stick with the 8-bits, people should at least strive for the logical extension of their
systems.

Especially with prices the way they are.

Even considering what the 8-bit market is today, in terms of prices, aside from the hard drive interface, it
is REALLY cheap to jump into the hard drive or memory upgrade domain.

Someone who has been squeemish for a long time should just realize that, hey,
times have changed, and there IS an upgrade path.

What I DON'T want to see is anyone jumping ship because they have NEVER heard of a black box.

Some isolated user says "oh, I love my 8-bit but I need a hard drive and I wish I could use a 19.2K modem so I'll
get an IBM"

There are TOO many people like that.

If they are going to leave us, they better know what is out there.

It really is kind daunting though.

You go to a user group and you expect everyone to be as fired up about the stuff as you are and you leave there
realizing that you are into it more than anyone else.

It isn't something you'll experience with other user groups for other platforms.

For an 8-bit ONLY user it is really tough finding other people who share the same enthusiasm, and this is the core
of my frustration.

For the half/time 8-bitters who have moved on, they ho-hum and sigh at the cool hardware.

It would have been great if it was 85 all over again, I bring in an MIO and everyone leaves there thinking "wow"
I'm gonna save up for one!

But people must be thinking, "That is cool, but it has no relevance to me, thus it is useless..."

In that way I can not connect with these people because they are either first time 8-bitters who probably won't last
long in the platform, or they share their time with other platforms and just aren't into it with a PASSION.

I don't see how anyone can come down on me for this....

I am not condemning them for their beliefs, if they aren't into it they aren't into it!

But it is really tough dealing with people who up to a certain point, CARE about the 8-bits, but then don't.

Like I have the new FRACTASIA program...

That is a perfect example.

The 8-bit huffs and puffs to produce cool looking 64 color Colorview Fractals.

I think it is a good solid example of the 8-bit exceeding its limits.

But to a half-time user they would yawn at it cuz they have similar programs for their VGA IBM.

For a half-time user any BIG jump in the atari is a novelty, but nothing really that they can't do on their REAL
machine.

Thus the core of a user group discussion, talking about USING new software and hardware, is invalidated since they
only play a few games and don't do any serious work on it, WP, Database, anything...

So I'm not so much pissed at THEM as I am frustrated with EXPECTING a certain level of excitement and involvement
and things coming up short. And despite all my best intentions, there is NOTHING I can do to liven things up.

From: phruby@ucrengr
Message-ID: <32732@galaxy.ucr.edu>
Source record: 106416

What I had in mind was to take a 2600 converter for the 5200 and somehow connect it to a 130XE. The 2600 converter could run off the 130XE power and video would be piped through the 130XE. Maybe there could be a way to capture files from 2600 carts and store them on disk. It would be sort of like the SNES copiers advertised on r.v.g.m. Maybe someone could write a cross-assembler for the 2600. (There is a cross-assembler for the ST to write SNES games). Interesting hack don't you think? Maybe, I'll try it this summer. Anyone want to help?

Source record: 106428

Ok, I have just recently run across an interesting (? -- perplexing, frustrating) problem. I just recently picked up a P:R:Connection and 2400 bps modem, excited about the faster speed, esp. when doing kermit protocol file transfers. But of course, there is a snag. I haven't been able to achieve a successful file transfer. It seems like it isn't receiving "whole" packets -- i.e. for each packet, there are a couple of SD's being sent, instead of the 1 checksum verification at the end of the packet. Occasionally, it appears to work normally, but always ends up with the message "cannot receive data." The funny thing is that it always worked great with a direct-connected SX212. The only thing I can think of is a possible conflict with SDX, but does anyone else have any ideas?

CC:
Subj: ECI vs. PBI
Enter your message below. Press CTRL/Z when complete, or CTRL/C to quit:
This is for Tony Lang.

Ah... first off, the 1200XL ain't got no PBI. On the XL series, only the 600XL & 800XL got a PBI. The 65XE has no parallel bus at all, but the 130XE has the ECI. (I view the 65XE as a dead-end machine, almost as worthless as the 400.) OK, we got that outta the way.

Mind you, I'm not exactly a heavy PBI hacker, I've only tinkered with things on a strictly empirical basis. I'm not 100% sure I agree that it's carved in stone somewhere you absolutely have to use HCT gates to drive signals on the PBI. Certainly it IS a good idea. I got into a heated discussion with Bob Woolley a few months back on this subject, as it was my contention that the speed improvement of HCT isn't that much better than LS. He went ripping thru my library looking for the spec book charts where they give speed comparisons of different logic families, I think we finally found the chart in a Motorola or Nat. Semi. spec book. I rather felt the two families should be more-or-less interchangeable on the basis speed per gate.

I was right, but so was he. My recollection is that LS will give you 3nS, HCT gets you down to like 1.9nS or some such. This difference is trifling, so in most systems- especially a fairly slow one like the 6502- LS & HCT are essentially equivalent.

BUT... as Woolley so annoyingly pointed out to me, the per-gate speed specs are deceiving. Because some types of chips employ multiple gates internally to achieve their logic functions. So what you should really do is take a look at the schematic of the particular chip you plan to use as given in the manufacturers spec book & count up HOW MANY GATES that chip employs to do its job. If it's only a few gates, you can get by with LS. If it's a whole bunch, better stick with HCT.

You'll always be safe using HCT, but HCT is more expensive & not always readily available, while LS is cheap & you can get them from every large mailoder house in a wide selection of types. I don't have a Black Box in front of me, but I seem to recall that on different BB's I've seen, Der Puffster seems to use LS & HCT interchangeably in certain positions on the BB board. (Dunno whether those chipsdeal directly with PBI signals, tho.)

Some people are a little sloppy about the difference between HC & HCT. In a 5-volt system, HC will USUALLY work. But HCT will ALWAYS work on a std. 5-volt bus. The internal gate count does seem to vary somewhat according to the manufacturer, which explains why one brand of chip miht work fine while a

different brand will fail or give scrambled signals.

As to the length of wire you can stick on the PBI- ah, one of the Alchemist's favorite topics! The BB & MIO employ short lengths of parallel ribbon cable, like 6 inches or so. I've heard tell you can't go more than 8 or 10 inches with this type cable before you start getting failures due to slewing distortion

of the squarewaves. It's the fast clock signals that are affected most.

It's impractical to stick long pieces of ribbon wire on the PBI & then make up for the signal degradation with fast buffers to snap up the squaerewaves (there's aspecial name for those, it slips my mind). damn....
Ah! Schmitt triggers. Anyway, the problem there is that the accumulated propagation delays get the buffered signals out of sync with other timing signals on the PBI, you just open a whole can o' worms.

My interest has centered on interaction of the wire you actually use with the signals on the PBI. The issue is impedance, which has 3 components: DC resistance, capacitice reactance (distributed capacitance) and inductive reactance. The problem is to find specs on the wire related to those properties.

From page 13 in the Dec. '92 copy of the Digi-Key catalog, you can get the specs on OKI & Hitachi ribbons. Unfortunately neither one gives the specs in a sensible format, so you sorta have to eyeball the numbers. I'm sure Jeff McWilliams or one of these enginerr-type guys could find an equation somewhere to calculate all this stuff exactly. (We Alchemists gave up on that approach long ago when we found the manufacturers lie to you half the time, rendering the equations useless.)

OK, we look at the worst case & tske it from there. 1.79MHz, right? Round it up to 2MHz for easy mental gymnastics. A rule of thumb is that to reproduce a squarewave accurately you must have a 10-fold excess bandwidth relative to the

fundamental frequency, in order to pass the upper harmonics of the wave. So, our cable must have 20-MHz bandwidth. In practice we could probably get by with a little less, 15 or maybe even down to 10MHz.

Now we eyeball the wire specs for 28 AWG parallel stranded wire on .05" centers.

Hitachi gives a specific DC resistance of .068 ohms/ft. Irrelevant (unless you're planning to run a couple miles of cable!). DC resistance isn't a factor.

The values for specific capacitance given for the two brands of wire are different, eyeballing the figures I'd say an average value of 15pF/ft. A 4-ft cable would give you 50-60pF, which to the Alchemists eye seems tolerable if not exactly healthful for the signal. Do-able.

OKI gives specific inductance of 20uH/ft. for their wire. Taking a 4-ft. cable,

we have 80uH. OUCH!!! Our clock signal just hit a brick wall!! Even the 6-inch wire on the BB & MIO will give you 10uH which is already degrading the signal somewhat (the 7pF capacitance doesn't help any either). Yuck!

Back in my audio guru days, before I learned tricks for stabilizing op-amp feedback circuits, I built an AF op-amp circuit whose output contained a low-level 5MHz oscillation. The RF aliased down into the AF where the harmonics were audible as faint "wispy" or "birdie" noises in the background, which drove me crazy. Using the "blowtorch" approach, I empirically manufactured a series inductor to suppress the RF without affecting the high end AF. By a process of winding, testing & measuring, I completely suppressed the 5MHz sinewave oscillation with a n inductor that turned out to be 80uH. (I was totally bummed out; if I had known it would be that value ahead of time, I would have just purchased a couple 100uH inductors at Radio Shack & save myself the trouble!) The impedances involved in that experience were on the same order of magniyude value as those in logic chips: a few hundred to a few thousand ohms. If 80uH will suppress a 5MHz SINEwave, THINK what it will do to a squarewave! Bleccch!

Now, what if you SHIELD the wire? This can change the AC characteristics considerably, depending on how you do it. I recently fished from the trash at work a piece of ribbon wire ca. 2 feet long whose conductors were in twisted pairs. Ooooo... possibilities! This wire has flattened areas every couple feet so you can attach standard IDE connectors (how thoughtful!). I tried it on my Black box. Two feet. It worked. You can buy this wire from All Electronics in Van Nuys CA for about a buck a foot.

I mentioned my twisted ribbon the other day to Der Puffster. He was skeptical. Said he woldn't trust such a thing, plus the fact that the pairs aren't actually shielded since most of the PBI connectors have signals on them rather than alternating sig-gnd-sig etc. Long-term testing of this cable is on my agenda, at the moment rather disrupted by various video experiemnts I'm messing with.

I think my wire works. Whether it works because I have the right theory, or because I just got plain lucky, I dunno. Bob Puff reported PBI characteristics themselves can vary from machine to machine according to how well the LSI chips in there are functioning. Ewwwww, that sucks. But personaly I've not yet encountered that particular nasty, we have to assume you got good strong CPU, ANTIC, etc. in there.

Apologies for the length of this missive....

- BEN POEHLAND
The 8-Bit Alchemist

2061. Re: length of MIO cable

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-15 15:48:34 UTC
From: Jim_Johnson@abcd.houghton.mi.us
Message-ID: <Jim_Johnson.0hn4@abcd.houghton.mi.us>
Source record: 106422

There was a question posted on why the length of the connecting cable on the MIO is restricted to six inches...

From my experience, it does not HAVE to be this short. I know why it was designed as short as possible: to reduce RF, signal loss, capacitance problems, etc. However, the cable on my one meg MIO was around eighteen inches long and I never experienced a problem.

I used my MIO to drive both serial and parallel ports, a SASI hard drive controller, multiple ram drives, and a small printer buffer.

By using a longer cable I was able to set my MIO on its edge at the back of my desk, so I had room to move my 130XE (320K) on my desk without a caboose making things difficult.

By the way, about the tenth time I had to reload the MIO setup and ramdisks because the power glitched, I replaced the power supply with a home brew uninteruptable power supply. I never lost a thing for the next two years I owned the MIO.

Get a 12 volt motorcycle battery 1 or 2 amp trickle charger and a 12 volt lead/acid battery (motorcycle, car, lawn tractor, etc. - the larger the capacity, the longer you can keep the MIO going in a power outage). Hook the charger to the battery, then hook the battery to the MIO with *three one watt diodes in series on the positive side to drop the input voltage to the MIO. (*notes: 1- the exact number of diodes isn't critcal, the MIO uses a +5volt regulator, but using too few will burn out the regulator, and too many will reduce the input voltage too much for the regulator to work. 2- these diodes will tend to get warm, so make sure the casing you put them in provides some ventilation)

The original power supply for the MIO had AC output and four rectifying diodes on the MIO's circuit board. You can feed the MIO a DC signal with no problems, providing you get the polarity right. If the power light doesn't come on, you have to reverse the polarity.

MAKE SURE YOU CHECK THE WATER LEVEL IN THE BATTERY FREQUENTLY!!! MAKE SURE THE BATTERY IS IN A WELL VENTILATED AREA, HYDROGEN GAS WILL BE PRODUCED WHICH CAN BE EXPLOSIVE IF ALLOWED TO BUILD UP!!!

OK, but just a few definitions so people don't jump on my case for improper use of the PBI. Officially in order to be considered a PBI device the thing has to do some of the stuff Jeff alluded to: utilize the math pack disable & have ROM that will be mapped into the $D800 area(?), etc. The XL series has the smarts in the OS to know when a PBI device is hooked up & turns control over to PBI ROM. As far as I know, the only true PBI devices are the Black Box & MIO & as far as I know CSS & ICD went in and disassembled the XL OS to find out how PBI drivers worked. They've never shared this info with anybody & Atari never published the source code. Any hack that doesn't take advantage of the XL OS is really just something hung on the buss & should work with any 8-bit if you're willing to get down & dirty by getting the same address/data lines off the mother board. I only hang stuff on the buss=> limit of my abilities.
What I mean by a clean design & I think what you mean by how to decode: 6502's use memory mapped I/O, it's really a beautiful way of doing things, especially *IF* you use chips that are designed to work in 65xx 68xx systems. I've hung a couple of 6520s using different schemes, done the design for a 6551 ACIA but haven't had the time to start wire wrapping. The best way to do these things is via the hack Jeff & I were talking about, desolder the 74LS138 on the mother board & add another one along with the the extra address lines so the existing chips [POKEY, GTIA,...] are now in the bottom half of their current page & you have the ability to select one of 8 devices using the pins on the 2nd '138. This scheme only presents 2 TTL loads to one pin of the MMU & 2 address lines in order to add 8 devices. All that & the propagation delays to the chips !CS lines would be identical to what the existing internal chips is. You can tell the engineers were no longer in charge at Atari because it would have only cost maybe $.20 a computer to add a '138 here & bring these lines out, or at least the single line from the MMU. But... they aren't there! So next, single chip decoding with actual signals you find on the PBI. 1st get a couple of 74LS688 or 74LS521. These are 8 bit comparators. Pop out your programers calculator & key in hex, $D7, then binary, it'll show: 11010111 Now tie the 'A data lines of the comparator to either ground or +5V to match that bit pattern. Then tie the 'B data lines to PBI address lines A8-A15. Since you used the upper 8 bits of address line, the '521 or '688 will provide a low pulse any time the buss address is in the range of $D700 to $D7FF !O when A=B. This low pulse line goes to the !CS of the [6551, 6532, 6520, ...]. To select the internal registers of the 6520 for example, you'd just tie address lines A0 & A1 to RS0, RS1 of the chip. For some reason Atari reversed it & tied A1 to RS0, A0 to RS1, bt it doesn't really matter as long as you know what they did. The rest of the lines are straight

forward; tie reset to reset, R/!W to R/!W etc. You're finished!
Hmmm... you want to add 8 6520s to the $D700 area? Probably wouldn't
really work but would make a decent example. Grab a 74LS138, tie the
!E1 pin to the !O of the '521 & the other '138 enable pins to always
be true. Tie a !O pins of the '138 to each one of the 6520s' !CS pins
with the 6520s all having the same connections as above to A0 & A1,
data, etc. Now if you want page $D700 to be divided into 8 equal
parts, you just tie address lines [5,6,7] to the '138's address lines.
Now when you read or write to the 6520's registers, you just start
each one with a 32 byte offset. Mix a 6522 in there? Just use
address lines [2,3] to RS2, RS3 of the 6522. If you're a Jeff
McWilliams type i.e. "Don't waste a byte anywhere in the memory map!"
for 6520s you'd just use address lines [2,3,4] to the 138, maybe
address lines [5,6] to the other enable pins of the '138, address line
[7] to the enable pin of the '521. This would make the 4 registers of
the 8 6520s appear as 32 consecutive bytes in memory. You could also
add a 2nd cascaded or parallel '521. Most of the other designs I've
seen use multiple cascaded logic chips to do the same address decoding
(vs a single '521 or '688). Even if they only present one load, the
delays from cascading these things is probably enough to cause
problems. You also have to be a lot smarter then me to figure out how
to decode memory addresses with those things <grin>.

A ribbon cable is a sort of imperfect transmission line, and transmission
line design parameters come into play.

>

>with a little less, 15 or maybe even down to 10MHz.

For a transmission line, with end not properly terminated, the significant
problem is reflections from the ends, which leads to _ringing_ in the edges
of the signals, and mucho logic misinterpretations possible. The significant
effect is the propagation time from end to end, primarily in relation to
the rise time of the signals. For typical TTL level signals, typical
rise times are of the order of 1 or 2 nano seconds. The approximate
speed (very approximate) of most cables will lead to about 6 inches to
a foot per nanosecond ... hence an improperly terminated line is good
for up to a foot or so with TTL type signals.

>inch wire on the BB & MIO will give you 10uH which is already degrading the
>signal somewhat (the 7pF capacitance doesn't help any either). Yuck!

For a transmission line, assuming the series resistance and parallel
conductance are negligible, the effective impedence is sqrt(L/C). Hence
for this ribbon cable, sqrt(20uH/15pF) which is 1154 ohms (gee .. that is
high .. wish I was home and thinking clearer).

Looking in the DigiKey catalog, their ribbon is specified as 100
or 110 ohm impdenece when used in ground sig ground arrangement.
(Confused as to the 1154 ohm figure above .. difference between

theory and practice, or more likely between measurment frequencies)
But this is with the line used ground-signal-ground.

>
<deletions of audio stuff>

>Now, what if you SHIELD the wire? This can change the AC characteristics
>considerably, depending on how you do it. I recently fished from the trash

Effectively making the line more aof a predictable transmission line, probably
increasing the effective capacitance, making a better match for the TTL,
and cutting down on signal to signal crosstalk.

>rather than alternating sig-gnd-sig etc. Long-term testing of this cable is
>on my agenda, at the moment rather disrupted by various video experiemnts I'm
>messing with.

Since the sgnals are not paired (sig-ground or sig+-sig-) this would
not necessarily be mucho better. BUT if the wire is designed with a
lower impednce ... then great stuff.

Better, in my opinion, would be the shielded flat cable. This is available,
though it can be hard to use. Failling that, I would use flat cable,
and have, with every other line grounded. You need a solderable set of
connectors, rather than IDC type, and pull every other lead up in the air.
After connectors are wired, tie all the grounds together.

Standard practice in many bus oriented designs is to terminate the bus
lines to dampen the ringing. A multiresistor 220/330 ohm pack can be
readily used for this, which has a parallel equivalent of 132 ohms,
a decent match for the 100-110 transmission line. The question would
be, can the drivers inside the Atari supply sufficent drive, or would
hacking be required.

One would still be limited (assuming line terminated and driven) by
the propagation time. This is listed in Digikey at 1.4 nS per foot.
So 2 feet would be about 1 LS TTL gate delay. If bus drivers/receivers
were added in the Atari, their delays would also have to be considered.

>
>I think my wire works. Whether it works because I have the right theory, or
>because I just got plain lucky, I dunno. Bob Puff reported PBI characteristics

I would tend to think, possibbly less crostalk, perhaps less capacitance
line to adjacent line .. perhaps some luck (as to which signals are separated
more, ring less, whatever).

Crosstalk was the problem I encountered on my first computer setup when
I neglected to terminate the floppy drive bus. The system would work fine
most of the time .. but intermittently would write to a floppy it was reading.
I speculate that ringing in the nonterminated data lines crosstalked into
the write gate line .. I think from the step signal. Terminating the floppy
bus cured the problem, of course.

>themselves can vary from machine to machine according to how well the LSI chips
>in there are functioning. Ewwwww, that sucks. But personaly I've not yet
>encountered that particular nasty, we have to assume you got good strong CPU,
>ANTIC, etc. in there.

How long of a cable do you want/need? Perhaps a modification or bus driver
add-on would enable enough cable to meet most needs. If we have 10 nS to
play with, outside of gate delays, we could add 7 feet of cable.

Message-ID: <1993Jun15.184100.16486@jupiter.sun.csd.unb.ca>
Source record: 106427

I have a couple of questions about the archives if someone doesn't mind
mind answering them.

I downloaded a few .ARC files and ARCX.COM for a few people I know
with Ataris.
If I move these files to an ATARI system, is ARCX.COM used to uncompress
them?
I also noticed a few other extensions. Are these uncompressed by a different
archival program?

Thanks.

2066. Re: ECI vs. PBI

> Delay time (ns) static @ 0.1 MHZ
>4011(CMOS) 50 .01uA .08mA
>74C00 50 .01uA .08mA
>74HC00 8 20 uA .14mA
>7400[TTL] 13 3 mA SAME for all TTL Chips
>74LS00 7 2.4mA
>74S00(Schottky) 4 20 mA
>74ALS00 7 1.5mA
>74F00 3.7 7 mA
>

Either the F series, or HCT and HC. HC and HCT provide better noise
immunity. As Jeff Potter just wrote, using 1K pull up resistors with
F series chips would also work.

>Also another question I have, and asked before is:
>How do you compensate on the 130XE for a LACK OF a EXTENB signal?
>Do you just do your own address decodeing and drive the EXTSEL
>signal as normal, along with the MPD. ?

Well, basically I THINK all EXTENB does is tell your PBI circuitry
that it's legal to return a EXTSEL and MPD signals to interface your
circuitry into the 6502 memory map. FOr example, I'd not expect
EXTENB to be active when the 6502 is addressing the hardware area,
and possibly not the OS ROM area either (expect for the math pack area).
I would expect EXTENB to be active when the 6502 is accessing other
standard parts of RAM, $D100-$D1FF, and pages $d6 and $D7.

According to the SAMS 800XL schematic, EXTENB is provided by the MMU,
which has various inputs, A11-A15, S4, S5, MPD, and a whole slew of
other stuff.

EXTENB and EXTSEL' are ANDED together and then fed into a 375, which
is a latch. The latched output is then fed into an AND/OR Invert GATE
which provides CAS and RAS to the rest of the system.

Personally, I can't think of WHY you would AND EXTENB and EXTSEL'.
You would think you would want to AND EXTENB and the NOTed EXTSEL',
because such an operation would then indicate, when the output is
active, that the MMU says it's legal to enable PBI circuitry,
and the circuitry itself has requested being enabled. I'm gonna
have to re-read the ANTIC article I guess, and do somre more
figuring. Sure would be nice to know how the MMU was programmed.
It's basically a PAL, so somewhere, out there, somebody must know
the BOOLEAN expressions that were programmed into the darn thing.

I would have to say, the only difference in your circuitry for the 130XE
is that your enable circuitry now only depends on address decoding,
as opposed to adress decoding AND the EXTENB signal.

Jeff

> Any possibilities that anyone who has the aforementioned Analog
>could post the scematics in some way? Also, is an Octal BUS transceiver
>merely an Octal LATCH Buffer that allows the data signals to go both ways
>depending on the R/W signal?

Tony,

Use a 74F245 for the bus XCEIVER, use the R/W' signal to drive pin 1,
which is the transmit/receive pin. You'll have to figure out which
way transmits, and which one receives, so that you wire the
two 8 bit I/O pins correctly. A 74LS244 is used to buffer the address lines.
Er, actually two of them would be used.

Jeff

Source record: 106429

Gee, everybody's writing about this PBI cable length problem.
I don't have an XE, and don't use the PBI/ECI for anything (yet).
But I do have much experience in driving cables... From Ben's
description it sounds like crosstalk was your big bugaboo. A piece
of flat ribbon cable, with few grounds, tends to let the signals
induce noise on adjacent ones with reckless abandon. Separating
all signals by using that twist-and-flat ribbon cable (where each
signal has its own ground, hopefully from the device that drives
the signal for good ground return) will allow you to drive the
signals much cleaner.

On an old system that talked to a VAX using their DR11-W interface,
the recommended flat ribbon cable (without interspersed grounds)
was a disaster. We had to build in extra microseconds of delay
to wait for the signals to stop "talking to each other" on a 50
foot cable. One day we tried building a custom cable, where every
signal had its own ground, used this twist-and-flat ribbon cable,
and needed over 200 feet. It worked like a charm, and we could
pull out the majority of the wasted microseconds as the observed
signals were much cleaner. Note: this system had nothing to do
with my Atari 8-bit.

I doubt you can run anywhere near 200 feet on your PBI/ECI (since
its probably driven by a weak NMOS device, and possibly not
terminated) but twisted pair with ground returns *really helps*.
Of course there are about a dozen other phenomena (transmission
line effects, ground bounce, capacitive loading, propagation delay,
etc.) that need to be taken into account.

2070. 256k Upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-15 22:04:43 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1993Jun15.220443.15631@austin.onu.edu>
Source record: 106431

I just bought an 810 drive and 256k expanded 800XL for $5.00!

Now that the shock has passed, I have a question or two.
The 256k upgrade is very unique. I wouldn't be surprised
if it was a one-of-a-kind. It uses nine I.C.'s, 8 256k
150ns rams, and a 74LS153 (I think). It doesn't appear to
be compatible with any other type of upgrade I can find.
The upgrade is really cheasey (ie not very professional).
Could some of you tell me what your upgrades look like to
see if maybe I have the same type? Also, if it is a one-
of-a-kind, can anyone speculate how hard it would be to
make it XE compatable?

Any help would be GREATLY appreciated.

Thanks,
Lance "Ate_bit" Murdock

2071. More 1050 Probs

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-15 22:27:23 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1993Jun15.222723.20941@austin.onu.edu>
Source record: 106432

I just read another post about someone having problems with
their 1050. I have a non-working 1050 that I have been
meaning to tear into. Maybe someone here can help.
It powers up perfectly, drive turns, head makes all the
proper noises, etc. But whenever the drive is daisy
chained into a system, it screws up the system. When
turning on the computer, it screeches and IMMEDIATELY
drops you at the BASIC prompt. Hardly any timeout, or
anything, just a terrible sounding screech, then the
prompt. (The drive also tends to get warm after a
very short while) My guess was that something connected
to the SIO had shorted (i.e. a transistor or I.C.)
The power supply's heating up kinda agrees with that.
The drive had been worked on once before (can't remember
what was wrong it has been so long) and I wondered
if maybe the same chip had gone bad. Donno, but it
is really hard to diagnose the damn thing if you
can't hook it up to your computer. Maybe I will try
to work on it tonight. Any help would be appreciated.

>Ah... first off, the 1200XL ain't got no PBI. On the XL series, only the
>600XL & 800XL got a PBI. The 65XE has no parallel bus at all, but the 130XE
>has the ECI. (I view the 65XE as a dead-end machine, almost as worthless as
>the 400.) OK, we got that outta the way.
[text deleted]

That is not entirely true. Later 65XE's did in fact come with an ECI built
in. This was explained in a little insert in the manual (you know those bits
of card that Atari used to stick in the manuals as updates in order to save
rewritting the manual, and always keep falling out!). I got my 65XE
in late 87 and it had an ECI. Does anybody else have a 65XE with an ECI?
or am I all alone :-(

ARCX.COM is an old, buggy program. It will probably work for most .ARC
files, but could give false error messages on some. A much better program
is Super Unarc (not sure what its file name on the archive is, maybe
superu.com ?) Super Unarc will also uncompress .ALF files. Another
program you will want to get is Diskcomm. This program compresses an
entire bootable disk into one file, usually with a file name ending in .DCM .

When you do an Xmodem or Ymodem download, Bobterm asks for the name of the file, and it shows "D1:", but you can backspace and change the 1 to another number. Then, if you save the configuration (type "J" from the main menu, then "3"), the protocol and drive you selected will be the defaults next time you run Bobterm.

True but the 5200 joy sticks are less than desirable. I like the idea of having them on the computer so I can use genesis pads of the standard Atari sticks if I want to.

In a previous article, ai792@cleveland.Freenet.Edu (Tony Lang) [or somebody; I've lost track] says:

Either the F series, or HCT and HC. HC and HCT provide better noise immunity. As Jeff Potter just wrote, using 1K pull up resistors with F series chips would also work.

Lots of misperceptions of noise immunity going around... thought I'd comment...

Both high and low signal levels (logic 1 or 0) can have noise immunity problems. Raising the high voltage helps on the logic 1 but does nothing for the logic 0. It doesn't help overall noise immunity to increase the logic 1 immunity if you don't do anything for the logic 0 immunity. In fact, raising the logic 1 voltage too high can actually create noise problems, because a fast large swing (the transition from a 0 to a 1 or 1 to 0) can couple-into a signal that's supposed to be low (re: the crosstalk discussion), since you haven't done anything for logic 0 noise immunity.

BTW for TTL compatible families the logic 0 is usually .3 or .4V, and the input logic low req. is around .8V. That's a noise margin of .5V, regardless of what you have for a high level margin. In large systems, it's logic 0 levels that have noise problems anyway, for obvious reasons.

If you're using TTL-compatible families, and your circuit doesn't work, the 3.8V high level is NOT the problem.

Note: One of the early fast CMOS families (HCT?) has a large transition (nearly 5 volts) and transitions so fast the transmission line characteristics are so pronounced that it was very difficult to build a system with it. You need a matched series terminator on a very large percentage of the lines, and thus the delay from the driver to the closest receiver is actually twice the prop delay of the line. Nowadays you see edge-rate control drivers on things such as BCT, because slowing down the transition actually allows the system to run faster. Bottom line: do not go by specs alone!!

I recommend F series for hacking around. It's pretty fast, the transitions are slow enough unless the line you're driving is long (a couple of feet), power dissipation is relatively low, input current too is relatively low, and output drive current is high.

Victor Parada G. (vparada@inf.utfsm.cl) asks:

> What *exactly* is a Null-modem cable?

It is a cable which connects the serial ports of two computers in such a way that, electrically speaking, each computer "looks like a modem" to the other computer. Each computer thinks it is sending data to, and receiving data from, a modem, when really it is sending it directly to the other computer. You can get fast file transfers this way because the only limit is the actual speed of the computers' serial ports, rather than the speed of some modem. (Oh, and by "serial port," I mean RS232, NOT the Atari's "SIO bus" port.) The important thing, and what distinguishes a "null modem" cable from a normal computer-to-modem cable, is "what pins carry what signals" at each end of the cable. The standard 25-pin RS232 connector carries data in one direction (I forget which) on pin 2, data in the other direction on pin 3, and "signal ground" on pin ??? (20? 7? Drat, I don't have my cable handy. Someone help me!). A computer-to-modem cable carries signals "straight through:

```
pin pin
2 ----- 2
3 ----- 3
X ----- X (the one I can't remember)
```

whereas a null-modem cable swaps pins 2 and 3:

```
pin pin
2 ----- 3
3 ----- 2
X ----- X
```

Obviously, these cables are NOT interchangeable. Somewhat less obviously, it is only a minor hack to convert one to the other, providing your connectors are of the proper gender.

It works for me!

I've got Bobterm 1.21 and 1.22.(I'm using 1.22 now)...some internal
changes but both run well....still got a bug in the capture buffer..
when uploading thru the text buffer (using BART) almost every time
the buffer refills it looses a few characters...watch the screen.
I have an xep80 and there's a nice straight column of "y"s as the
last character in everyline (ux?>~
uploading a uuencoded file..til
the buffer refills. I tried splitting the files into 16384 byte files
and thats how bit my buffer is...then I send the file filling the
buffer manually every time it empties.
It works if theres no noise online late at night.

Source record: 106449
Cross-posted to: comp.sys.atari.8bit,alt.folklore.computers

Ballblazer was a 7800 title... the cartridges are the same size as 2600 carts, but not compatible.

The 7800 has a bit more lines on the cart port.

There were a few products that added hardware to the 2600. The SuperCharger was a device that plugged into the cart port and attatched to a tape player. It added 6K of RAM (I think bank-switching was needed)...

You could a single stage program, that loaded itself into memory. There were also multi-stage programs.. So you have a very large game. And tapes cost less to produce than carts.

It never caught on with 3rd parties.. Arcadia (and later Starpath) released about 13 titles. I played 7 of them (rental!)... Star Raiders clone (Phaser Patrol) was a pack-in game. Asteroids clone (Suicide Mission... simulated vector graphics). Galaxian-like game (Communist Mutants From Space). Defender-like game (Killer Satellites). Break Out-like game (Fireball).

All had very good graphics... I liked Phaser Patrol and CMFS.

But neither were as good as "Escape From The Mindmaster"... a 3-d perspective maze game with logic/dexterity problems to solve. It had multiple levels (loaded from tape)... and an amazing end-game (I never got near it, but they had a display at a mall and I was present). It was incredible for the time.

The other good game was "Dragonstomper" an RPG of a sort.. first stage had a scrolling map, and moved around and entered commands with your joystick (I don't remember much)... then you bought supplies for your trip to the caverns.... I seemed to die as soon as that started.
My memory isn't as clear (only 10 or 11 at the time).

Jeff_M_Lodoen@cup.portal.com

Well, the Digi-Key catalog gives crosstalk for the ribbons (I'm doing this purely from memory) as 4% at the near end & 2% at the far end. Figure worst-case 5%.

I got no feeling for this. Assuming 4V peak-to-peak signals on the buss, you got 200mV of signal contributed from the adjacent line. In a configuration: sig-gnd-sig-gnd-sig the middle sig line will pick up from BOTH of the outer sigs. So, we get 400mV of crosstalk, right?

Not likely. In a dynamic environment some signals will cancel, only rarely will they actually add. You might get an occasional 400mV spike.

OK, again assuming the worst case, is a 400mV spike enough to disrupt, say, the clock signal? I guess this gets into the area of noise performance Jeff & Marek were babbling about.

I guess what I'm really fishing for is, just WHAT LEVEL of noise will the PBI tolerate?

As to the previous post treating the PBI as a transmission line model, yes I saw the nominal 105-ohm impedance values given in the OKI/Hitachi wire specs, but the conditions under ehich those numbers were obtained weren't fully explained. The impedance being a function of frequency & signal risetime & length of wire tested & nature of the waveform, etc.

For all of my figuring I assume a cable length of 4 feet, which for me makes the exercise worth doing. The 2-foot cable I made was just because I had the material in physically in hand & wanted to see if I could demonstrate the principle.

The fellow who mentioned he had a couple feet of parralel ribbon on his MIO with the motorcycle battery, etc. I believe mentioned the issue of RFI. The general rule of thumb I always apply is that anything which is itself a source of RFI is also more likely to inturn be affected by external RFI emissions (from TV set, househld appliances, whatever). To my mind extending the length odf parallel cable is taking a chance. My approach offers the promise of reliable peration under a variety of conditions.

When I find time (uh-huh, yeah, right!) what I really need to to is map out my cable relative to the PBI & figure out EXACTLY which signals are being paired by my twisted cable. Whaddayah wanna bet, there's probably only a few really critical signals in there, & they just happen to be the ones that are twisted with either a gnd or some logic-lo static DC signal. The fellow with the motorcycle battery knows his vable works- at least in his environment- because he DID it.

We can yak all day long on this net about transmission lines & impedance & all this other techno-bull, but it amounts to nothing till someone gets a hank of that cable & sticks 4 feet of it on their PBI. Either it will work, or it won't. If someone tries it & it fails, then we know.

And if it works, then it works, & as long as it works I'll be quite content to let the techno-babblers explain it while I go on to other things. We Alchemists do things by the seat of the pants, never admit the things we tried that failed but love to crow when we get something that works.

It's the Edison style of doing things.

Nope ... the ground will _shield_ the cross talk from the adjacent signal
lines, causing the signal to signal crosstalk to be much less. Ground
noise _could_ be a problem, but with many paralleled grounds, would be
much less.

>
>Not likely. In a dynamic environment some signals will cancel, only rarely

>
>OK, again assuming the worst case, is a 400mV spike enough to disrupt, say,
>the clock signal? I guess this gets into the area of noise performance
>Jeff & Marek were babbling about.

For TTL levels (which is what the buses use) the basic low noise condition
is the logic low state. Generally, an output low is speced at around
.4 volts, and a logic low input is speced at .8 volts, leading to a
noise margin of 400 mV. Typically, logic lows are more likely to be
around .2 volts (depending on how loaded the line is) and logic high
thresholds are around 1 volt or so. So typically, the noise threshold
might be as much as .8 volts.

But crosstalk depends on frequencies, higher at higher frequencies.
And here, the frequencies of interest are those in the rising edge
of the wave forms. As someone else mentioned, you can get less
crosstalk (longer cable lengths) by using slower logic, ie logic
with slower rise times.

Spikes induced from adjacent lines can be amazingly high in amplitude.

>
>I guess what I'm really fishing for is, just WHAT LEVEL of noise will the
>PBI tolerate?

Probable around 500-600 mv or so. But highly dependent on specfic
signal patterns and timings, ie there are times when a 1 volt spike
would not effect things, other time perhaps a 300 mv spike would be

too much (say if it occured during the rise time of a critical clocking
signal).

>

I don't have anything attached to the output bus (I barely have access
to the Atari .. dern kids) but if I were to design an attempt at the
longest _passive_ cable I would (in order of things to try):

1. Change connector arrangements allowing every other line to
to be grounded. If one does not have access to a solder
tail type connector that allows this to be relatively easy,
use a short _adapter_ cable to a custom connector, or
pair of connectors. (I tend to like Amphenol Blue Ribbon
type in general for twited pair/sig-ground applications)

2. If this does not allow enough length, I would try (pure speculation
here) putting small 5 or 10 ohm resistors in series with the
lines to dampen the ringing. (I have never tried this, but
it is a technique used in driving capacitive bus loads for
dynamic memory chips)

3. If I still had not enough length, I would terminate the lines.
For bidirectional lines, I would terminate each end with
a 440/660 resistor pair on each end, for unidirectional lines
the standard 220/330 resistor pair. I strongly suspect
that there is not enough drive current available for this
though. I would even try 1k/2k resistor pairs (one on each
line) as any termination will cause the ringing amplitude
to decrease.

I suspect that option 1 would be enough.

RFI would have trouble influencing digital logic, unless an actual
transmitter was invloved (we have one computer room here off limits
to walky talkies due to this). See noise level discussion above.
RFI would have a great deal of trouble inducing as much as 10 mV of
noise into the bus, and digital logic would likely not be effected.
RFI is a problem for TV sets and such because they are designed to
amplify low level signals (say a phono input of 10 mV, or an antenna
input of 30 microV) and any interference might be amplified as well.

>
>When I find time (uh-huh, yeah, right!) what I really need to to is map out
>my cable relative to the PBI & figure out EXACTLY which signals are being
>paired by my twisted cable. Whaddayah wanna bet, there's probably only a few
>really critical signals in there, & they just happen to be the ones that are
>twisted with either a gnd or some logic-lo static DC signal. The fellow with
>the motorcycle battery knows his vable works- at least in his environment-
>because he DID it.
>

Yeap ... probably correct here ... luck always plays a factor.

>We can yak all day long on this net about transmission lines & impedance &
>all this other techno-bull, but it amounts to nothing till someone gets a
>hank of that cable & sticks 4 feet of it on their PBI. Either it will
>work, or it won't. If someone tries it & it fails, then we know.
>
>And if it works, then it works, & as long as it works I'll be quite content
>to let the techno-babblers explain it while I go on to other things. We
>Alchemists do things by the seat of the pants, never admit the things we
>tried that failed but love to crow when we get something that works.
>

(don't mean to flame so don't take this wrong) What works works, and what
doesn't doesn't _BUT_ understanding what is going on, and how close one
might be to the limits, says a great deal for how reproducible/dependable
something is. It might work on _my_ setup at 3 feet say, but not on my
friend's at 2 feet .. perhaps because I use a metal desktop, and he uses
a wooden one, perhaps because I have airconditioning, and he doesn't. By
knowing what is going on, and why what I am doing works, I can better predict
if it will work for my friend. (And I know my friend will call at bedtime
to ask me for help <grin>).

>It's the Edison style of doing things.
>

Edison made literally thousands of variations of the light bulb,
determining what the limits were so as to make the product more
reliable and dependable, before his experients were done. Indeed
he founded the whole idea of industrial laboratories for this type
of research.

> - BEN POEHLAND
> The 8-bit Alchemist

>
>**

Soon I will be getting another 1050 or two, and get a second Atari
up and running. Although there is never enough time, I will certainly
be digging into my collection of stuff, and will let the net know
if I learn anything useful.

In a previous article, withers_n@kosmos.wcc.govt.nz () says:

>Does anyone know what to do with this program? I got it from
>atari.archive.umich.edu and it is supposed to be an MS-DOS program
>to read Atari disks.
>Several of us have tried to unarc it using a PC, an(-bit Atari and
>even a Commodore.

The latest version of UTIL is contained in 8bit/Diskutils/dskutil.arc.

UTIL is a popular way to read/write SS/DD 180K MYDOS-type Atari disks with
an MS-DOS machine. The directions for earlier versions are quite difficult
to figure out, but the version in dskutil.arc is supposed to work better.

[Bobterm losing characters during captures]
That might be the fault of the system you're capturing from. When Bobterm is ready to save the buffer, it sends a control-S character, which should tell the other system to pause until it receives a control-Q; but some systems only pause for a limited time, then start sending again.

control-S and control-Q don't even work right on the freenet
system I use so I just read the 1st page and quit then send the
msg to a file so I can download it (It could be a uuencoded
file) but How about SENDING uuencoded files from the text buffer
using Bobterm's xon/xoff-->between buffer refills it looses
characters at times also and sometimes it add a few characters
I suspect this adding of characters is line noise but how come
it sometimes looses characters?

>
>Gerzson Szinyei

Hola mundo.

Here, in Chile, an Atari-2600-like machine appeared on some
stores.
It's name was "2600 Game System", and some of them were
manufactured in Brasil (I guess).
They had 64 or 128 games, and were selected using a combination
of the select and start buttons.

It also appeared a Atari-like cartridge for any 2600 compatible
with a log_base_2(number_of_games) switches and number_of_games
equal 4, 8, 16, 32, 64, or 128. I think they are the same of
the console.

Some time ago, I opened a cartridge with 5 switches (one of
them failed), expecting to get a big eprom, but... it appeared
a small board, with the switches soldered to it, and something
like a watch batery in the middle.

I think this is also a kind of piracy for the games code included
in the console and the cartridges.
For the hardware, a 2600 compatible is like any PC compatible
for the IBM. They have some hard modifications in order to
proccess the built in games, and some components were changed
due to tecnology.

What about this?

Xao (bye)... ++V

Hola mundo.

I'm doing a simple database of those who read this newsgroup at
least once a week.

The following are all those guys that posted me their addresses, in
arrival order.

I received few comments about theirselves, so I decided not to
include that info in this post.

Those who didn't post to me or their post were devoured by my system,
or want their addresses to be changed to a desired one, or just
be deleted, just e-mail me.

I didn't include those who e-mail me as a reply for a mail from me,
and didn't write explicitly to be included.

Still waiting (some guys don't read the newsgroup directly)...

> I use K-65 under SDX w/ no problems, so I don't think it's that.
>
> What I haven't tried is 2400bps xfers with K-65. Anyone?

The nice thing about this problem is that I can still have the
SX212 connected and use it for file transfers, but I would much rather
use the Zoom instead. I have also tried 1200 bps on the Zoom, but still
no success. I know there was a problem w/ Kermit, file transfers and
SpartaDOS, but that bug had been fixed. I use the NR version - no
handler, so I first use the SDX 'RS232' to load the handler. I'm
still experimenting...

I have looked inside my 65XE (once!), and I don't have it with me right now, but from what I can remember it had a row of 8 RAM chips down the left hand side of the motherboard, and to the right or them were gaps for 8 more RAM chips, there were no chip holders in place, just the solder pads and the markings on the motherboard. If I remember correctly the gap for the RAM chip on the lower right hand side had a resistor placed across two of the connections. Plus I also noticed that there were a couple of other 'empty' gaps on the motherboard which had the solder pads for some 8-pin chips of some kind. I have also looked inside my 130XE, and the motherboards were remarkably similar, I didn't check the revision numbers tho'.

Source record: 106367

Hello there. I finally found my Indus GT drive that I barried away
many years ago when the power supply went bad and the drive just
stopped working. What I'm looking for is the power specifications
for the drive. Also, looking at the main circuit board, i can see
a few parts that look like they need to be replaced. If anyone
else out there could give me the values of the following parts
I'de be forever grateful: [The parts are located next to the
20 pin ribbon connector to the drive mechanism and behind the SIO
connection closest to the Power Plug]

R12, CR3, C19, C21

I know R12 is fried completly, afterall I can see the wire in the middle
of it. (Dont ask how this happened) and CR3 (Ceramic Resistor?) has some
black chare marks on it, maybe from he resistor, maybe not. C19 and C21
are probably fine, but have the same chare marks as CR3.
I think C19 is marked I 5M, 104, and C21 is marked A 5C, 224K, 422.
(Nice Yellow Capacitors) and I think CR3 is marked 47, 42, 412.

Long time ago I had an Atari computer running rom based
software in my car. I used an amber surplus "Osborn-1" monitor,
which operated on 12vdc (easy to find in a car). To power the
800xl motherboard, I simply connected my 12 volt feed to a TO-3
package 5v regulator IC, which was mounted in a large heat sink.
The computer motherboard, regulator, cabling was installed under
the dash, and the monitor was bolted INTO the dash. It was pretty
cool- looked kinda "bladerunnerish" when I turned the key on, as
the monitor came to life with "basic bullshit" coming from the rom
based software.

It was purely for novelty- the computer was later
connected to a very poor quality voice syntesizer device which was
a black box that plugged into the SIO port (don't remember the
name). I would have it randomly say things like- "self destruct
has been activated, you now have XXX minutes to reach minimum safe
distance", and "passenger seat ejection system now armed.
Ejection will occur in 5... 4... 3... ejection has been
terminated." Made passengers eyes get REALLY BIG sometimes. It
was a great laugh.....sq

(oh and I almost forgot the favorite! WARNING-WARNING- RADIATION
CONTAMINATION! Sounded so cool on that BAD voice syntesizer....)

A public domain program called Term80 may be just what you are looking for. It uses a software only 80 column emulator. Note that it only supports XMODEM file transfers and is ackward for file transfers at best. However it has an okay dialing menu and is very good for reading messages.

I should point out that you will very likely be disappointed with an 80 column display on a television. Televisions simply do not have enough horizontal resolution to do 80 columns justice. I had a composite monochrome monitor that gave me a beautiful picture.

I don't have FTP privledges, so could some kind soul let us know if this program is in the archives?

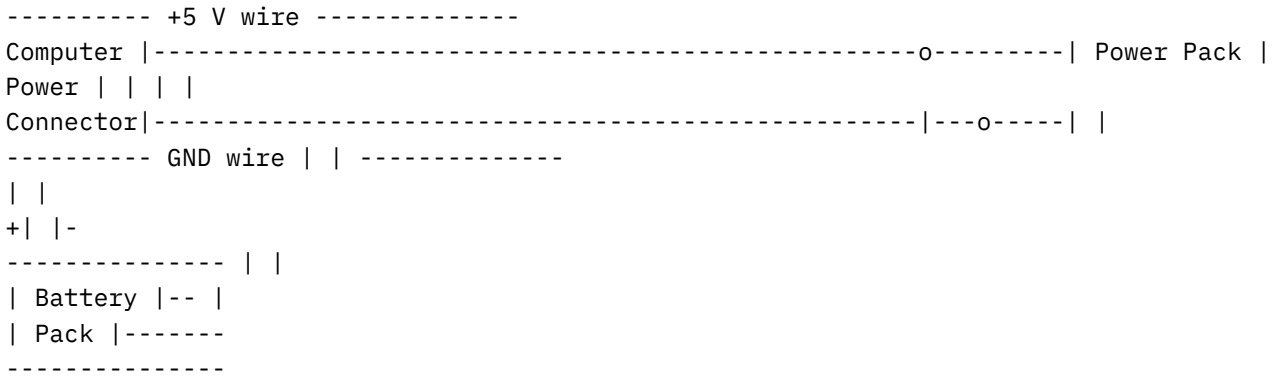
Many moons ago... when I was running the club BBS I designed a battery backup for the system.

It is so simple!!

The XL power pack converts the 120VAC out of the wall into 5VDC.

Get 4ea. 1.25V NiCad batteries and a cradle to hold them all. These can all be bought and Radio Shack. The larger the batteries, the longer your system will stay alive. I used D size for the club system. During testing they were able to keep the system going for about 30 minutes.

Cut the power cable on the computer side of the power pack, and then a meter check to see which wires are postive and negative. Connect the appropiate wires from the battery cradle to the the cut power cable wires, and then reattach the severed portion of the cable. (diagram below).



The Atari power supply will keep the batteries charging as long as it is plugged in.

While this is not the solution to allow taking your Atari out for plane trips, (etc), it will keep the system live during short power outages.

Hope this helps.

2113. 1050 problems

Newsgroup: comp.sys.atari.8bit

Source record: 106375

Sounds like the interface circuit on your main baord is giving you fits.

Try taking the cicuit board out of another (or borrowed) 1050 and using it in
yours. If the problem
goes away then the assumption would appear to be correct. It's been a looooong
time since I worked on these, but I seem to remember there being 1488 and 1489
line drivers and recievers as the interfaces chips on this board. I'll check
tonight and see. Replaceing the chips should be a breeze once you know which
ones they are.

In article 20941@austin.onu.edu, lmurdock@austin.onu.edu (Lance Murdock) writes:
> I just read another post about someone having problems with

2114. 256k Upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-21 21:22:12 UTC
From: popp@fledge.West.Sun.COM
Message-ID: <2058q4INNam4@west.West.Sun.COM>
Source record: 106376

Sounds like you have the famous Claus Burcholz mod!

It uses a autoexec program he wrote to use the expanded memory as a ramdisk, and
boy is it fast! Used with MYDOS it will let you set up one or two ramdisks.

I adapted this mod to work on a 600XL about 7 years ago.

In article 15631@austin.onu.edu, lmurdock@austin.onu.edu (Lance Murdock) writes:
> I just bought an 810 drive and 256k expanded 800XL for $5.00!

>Victor Parada G. (vparada@inf.utfsm.cl) asks:
>
>> What *exactly* is a Null-modem cable?

It's funny, but the same day I posted my question, I read the answer
in a local magazine.

>It is a cable which connects the serial ports of two computers in such a
>way that, electrically speaking, each computer "looks like a modem" to the
>other computer. Each computer thinks it is sending data to, and receiving
>data from, a modem, when really it is sending it directly to the other
>computer. You can get fast file transfers this way because the only limit
>is the actual speed of the computers' serial ports, rather than the speed
>of some modem. (Oh, and by "serial port," I mean RS232, NOT the Atari's
>"SIO bus" port.) The important thing, and what distinguishes a "null modem"
>cable from a normal computer-to-modem cable, is "what pins carry what
>signals" at each end of the cable. The standard 25-pin RS232 connector
>carries data in one direction (I forget which) on pin 2, data in the other
>direction on pin 3, and "signal ground" on pin ??? (20? 7? Drat, I don't
>have my cable handy. Someone help me!).

The pin of ground is 7 on a 25-pin connector.

> A computer-to-modem cable carries
>signals "straight through:
>
> pin pin
> 2 ----- 2
> 3 ----- 3
> X ----- X (the one I can't remember)
>
>whereas a null-modem cable swaps pins 2 and 3:
>
> pin pin
> 2 ----- 3
> 3 ----- 2
> X ----- X
>

X=7.

In the map I saw, there was also a connection of pins of the same side,
on each side: 4-5-8 and 6-20.

>Obviously, these cables are NOT interchangeable. Somewhat less obviously,
>it is only a minor hack to convert one to the other, providing your
>connectors are of the proper gender.
>
>It works for me!
>
>Chris Chiesa
> Chris_F_Chiesa@cup.portal.com

Thanks anyway...

I'm still trying to connect a PC to my 800XL without an AT850...

I tried by connectind two ataris with a XM301 modem by connecting the
modems directly using a simple phone connector. It failed.

Then, I tried connecting both modems to the same local phone line
(Just as someone explained here between a Mac and an Atari), but
I couldn't get both computers on line at the same time.

Communications SW? I used XE-Term (I guess) and Mini Office II.

Any (new) idea?

> So you are saying that I can capture an Xmodem transfer to my ramdisk?
> I assumed the screen capture only worked with text, not xmodem data.

D'oH! I said "<apture / destination / .."

Say you had RAMDrive set up as D8: ....

When you say [R]e<v. X-modem, it says "Destination file?" or something.
You type "D8:name.ext". If it says "D:", delete the ":" and type "8:"
and then the name.

If you want this setup forever, save the @onfig ([J]-@onfig, then [2] I
think, for "save". IT WILL BE SAVED TO "D:BOBTERM.@FG" tho! So be sure
the proper disk is in drive 1 aka on most DOSes: "<urrent dire<tory.")

I usually have my RAMdisk set as D9:, and my BobTerm dest/sour<e's are
all just "D:". (Ex<ept I think for a while I used to print @apture, so
it's dest. was "P:")

BTW- What DOS do you use? AtariDOS? MyDOS? SpartaDOS? Does BobTerm
work 100% ok with Sparta? I forget. Also, does anyone know why MyDOS
has two ways of doing dire<tory-style stuff? (make/<hange/et<.)

MyDOS has the "normal" ones, and then the ones with the same XIO <all
number as Sparta. I guess they both started out their own ways, then
WordMark (WoodMark?!) de<ided to make it more Sparta <ompatible....?
Is there any dox on the "history of MyDOS"?

Ok... I'm done! ;)

> entire bootable disk into one file, usually with a file name ending in .DCM .

<errrt!> Wrong! Disk@omm (Disk @ommuni<ator 3.2(?)), unfortunately,
does NOT <ompress. It doesnt store empty se<tors, however, whi<h is why
not all .D@M files are the same size for their density (88k = single,
127k = 1050, et<..) I'd really like to see Bob Puff or someone else make
a ni<e <ompressing .D@M'er that does/undoes <ompressed "disk images"
(that's what they are.. they even store the boot se<tor / dire<tory /
et<..) as well as at least undoing the old, plain .D@M's.

BTW- Yeah... "MOST" disk image files are ".D@M"...
some are .DSK, tho
some are .DS@...
some are .D@#, where the # is some number
(this is probably from the old
BBS Express! days, where files didnt
have "des<riptions"... they had
<ategories, determined by the three
bytes of the extender....
and by the sysop..
so nothing's ever the same
<sigh>...
<ool <on<ept, tho.. using extenders
for des<riptions. Personally, I'd
just make a subdire<tory with a bun<h
of files with the exa<t same names,
and they'd store the file des<ription.)
(speaking of dire<tories.. I still want to make an
i<on-based program-laun<her that looks like a good
ol' ST or Ma<Intosh GUI ... but the i<ons would be
determined by extender. .TXT files would look like
pei<es of paper... et<.
I <ould make it where some files had their own i<ons..
... but they'd have like two files... the a<tual file,
and then an unlisted (YIKES! HOW WINDOWISH! EWW!)
file with an extender of .I@N or .I@O or something...)

What a strange looking post, no? ;)

Cross-posted to: comp.sys.atari.8bit,alt.folklore.computers

I have a Basic cartridge with associated keyboard for the 2600.

The keyboard is connected with a cable to the cartridge, and from there
are two cables to be plugged in the joystick connectors of the console.

The keyboard is labeled 'Spectra Video' made in Hong Kong, and contains
39 keys (qwerty) without space bar. The space key has normal key size.
Additional there are shift, enter and func - keys.
On the side there are 'mic' and 'ear' connectors for a cassette recorder.

The cartrigde itself contains:
1 HM 6116-4 (2K static RAM)
1 GI: 9128 B - 1041 (?K mask ROM)
BD-015-P
1 74LS00
1 74LS122 (a monoflop!)
1 Transistor
and some resistors,capacitors

all parts are from 1984.D

the board is labeled: SP 01004, Version 3.3

I'm not up to date... Most of the non-atari hardware for the 8bit never
arrived to Chile, like advanced disk-drives (Percom, Astra), US-doubler, etc,
so I don't know what is a "SS/DD 180K MYDOS-type Atari disks".

Can I R/W that format in my 1050 standard disk-drive?
Do I need the XF551 (that's the number?) ?

Thanks...

> Joe Sabatino -->ab588@yfn.ysu.edu

WOW! you got a 16k buffer?! geez! I usually have only a 12k one.

Hey...what works GREAt for me is this:
As you're sending your buffer out (Send AS@II), wat<h the buffer size
When it gets around 256, start pressing [^S] and [^Q] to stop, and
restart, the send. You'll PROBABLY find that when you press [^S], the
buffer stops, but the e<ho from the pla<e you're <onne<ted to still
keeps going. You should a<tually press [^S]/[^Q] every on<e in a while
anyways, but DEFINITELY when the buffer gets near empty.
Then again, when you have a RAMdisk, the speed/la<k of physi<al goings
on over the SIO will probably keep you from needing to do this... but..

Don't ever trust somebody else's buffer! ;)

A standard 1050 drive can only read and write single density (128 bytes per sector, 720 sectors per disk) or enhanced density (128 bytes per sector, 1040 sectors per disk). UTIL only works with 256 byte sectors, but somebody recently wrote a program called MULE which supposedly works with an unmodified 1050 drive. This MULE is not to be confused with the game called MULE.

Nicad batteries are _not_ designed to be charged in a constant (regulated) voltage circuit. This circuit would likely not give the Nicads a full charge, and t he recovery current (after use during a power dip) is not regulated and hence may be excessive for either the power supply or the Nicads.

Somewhat better would be to diode isolate the nicad pack, and run a small separate plug in supply thru a resistor to recharge the Nicads.

showing only positive leads, all grounds (negatives) common:

```
atari supply ------------------------------------------------ atari jack
|
resistor diode |
nicad supply ----------------------/\/\/\/\/\/---+----|>--------+
(9 volts nominal) 100 ohms | (1 amp)
1/2 watt |
|
nicad plus
(say 1 amp C cell
pack series connected)
```

This would limit the charging current to about 40 mA which should be adequate for a continuous trickle standby operation without shortening nicad life or capacity, while taking two days to fully recharge from a lengthy outage.

2134. Classic 8-bit stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-23 17:11:54 UTC
From: potter@sunny0.DAB.GE.COM
Message-ID: <C933rv.CwG@sunblossom.ge.com>
Source record: 106395

I ran into a guy who has the following stuff he's willing to sell.
I'll give the starting prices; anyone really interested in obtaining
certain items can bid higher. I'll resolve bids by e-mailing results
to interested parties. We'll try to clear this up by June 30th.
Postage to be paid by the buyer; package deals will be considered.

Hardware:

Atari 800, stock, working condition $30
with power supply

Atari 1050, stock, working condition $40
quiet, clean, with power supply
and SIO cable

Cartridges (all w/o docs or box, but in working condition):

Atari BASIC $5
Atari Pengo $5
Atari Dig Dug $5
Atari Missile Command $5
Atari Centipede $5
Atari Star Raiders $10
Atari Eastern Front (1941) $10
Activision H.E.R.O. $5
Activision Zenji $5
Parker Brothers Astro Chase $7
Parker Brothers Popeye $7
Parker Brothers Super Cobra $7
Epyx Alien Garden $5
Thorn EMI Computer War $7
Big Five Miner 2049'er $10

Books:

DOS 3 (Atari) offer
Compute!'s First Book of Atari Graphics $7
Compute!'s First Book of Atari $7
Compute!'s Second Book of Atari $7
The ATARI Assembler (Reston) $7

Also: disk versions of Boulder Dash, Mr. Robot & His Robot
Factory, and Lode Runner, whose conditions (working or not)
wasn't determined yet. I'll report later if interested.

(Don't worry guys, I'm not selling out of my own 8-bit
equipment :^).

2135. Atari mods on file

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-23 17:29:27 UTC
From: popp@fledge.West.Sun.COM
Message-ID: <20a3tnINN9ig@west.West.Sun.COM>
Source record: 106394

After digging through the dusty archives of my closet last night, I dug up
all my old Atari information. I have the following mods available if you
are interested:

System Mod (description) Author Difficulty

400 64K memory upgrade Jerry Richter Easy-Moderate
(Converts the single 16K
board 64K)

400 On-board BASIC upgrade Jeff Popp Moderate-Difficult
(Basically adds a second
internal cartridge slot
which is switch selectable)

400 Monitor circuit upgrade Antic Magazine Moderate-Difficult
(Breadboard circuit add-on)

800 Dual Cartridge slot modification Jeff Popp Easy
(Allows you to make use of both
cartridge slots and switch be-
tween them)

600XL 64K memory upgrade Rich Andrews Easy
(Converts 16K on CPU to 64K)

600XL Monitor circuit upgrade Jeff Popp Easy
(Adds monitor circuit to CPU
board)

600XL 256K XE compatable memory upgrade Jeff Popp Difficult
(Adaptation of the Buchholz
800XL upgrade)

800XL 256K XE compatable memory upgrade Claus Buchholz Moderate

1200XL Monitor upgrade Rich Gratzer Easy
(Makes the video quality match
other 8 bit systems)

130XE 320K memory upgrade Scott Peterson Moderate

130XE Monitor upgrade Rich Gratzer Easy
(Makes the video quality match
other 8 bit systems)

2136. PBI vs. ECI

Newsgroup: comp.sys.atari.8bit

From: poehland%phvax.dnet@smithkline.com
Message-ID: <9306232056.AA28420@smithkline.com>
Source record: 106397

Whoa, Jim! Don't give up on a long(er) connector for your PBI just yet.
I'm not at all sure we HAVE reached any kind of concensus on whether it's
possible or not, only that no one is sure & no one will know until somebody
Out There does some tinkering.

I'm here to say that I'm comfortable so far with my 2 feet of twisted cable,
which is availble for $10 from I think All Electronics in Van Nuys CA. Making
this cable would be a simple matter of carefully removing the 50-pin IDE
connectors from the existing piece of cable & clamping them onto a hank of that
twisty stuff. You would definitely need a bench vise for attaching the
connectors, pliers just won't do on a 50-wire cable like this. The twisty stuff
has flat areas every couple feet where you can attach your connectors.

Four feet, man wouldn't that be nice?

2140. Kermit-65 & P:R: update...

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-24 06:43:00 UTC
From: Dag.Hugdahl@tdkt.kksys.com
Message-ID: <740910413.AA08295@tdkt.kksys.com>
Source record: 106402

Well, still no luck. After messing with different SDX CONFIG.SYS configurations, different DOS'es (MyDOS, Sparta 3.2), different Kermit on my host site, baud rates, etc., I still am having problems w/ Kermit file transfers. I have had the Kermit at the site log the packets for me and it seems that most of the blocks need to be resent, starting from the very beginning of the file. While watching during transfer, it seems as though the Atari is never in sync with the packets being received. It seems like the Atari sends a type of acknowledgment in the middle of a packet, which in turn causes the packet to be resent, which does eventually allow the packet to be received correctly. This of course takes about 10 seconds for one packet. Every once in a while I will have a successful file transfer, but most of the time it ends up "cannot receive data." Which leads into...
For a last ditch effort, I am looking for the file PRC.SYS, supposedly a file from ICD that came with the P:R: that enables it to be more 850 compatible. I bought my P:R: used and it didn't come with a manual or disk. If anyone has this file, could they send a .UUE version to:
hugdahda@martin.luther.edu

I will be hooking up the SX212 so I can do Kermit file transfers. I really don't know what else to try... the P:R: works great with everything else.

I was recently trying out some old cartridges that were collecting
dust back on a atari 400 i obtained. Out of the 12 games, all but 2
didn't work. And as luck would have it, one of those was my favorite,
which I really wanted to play. :-(The games is called FORT APOCALYPSE
from synapse. All I get when I plug it in is a completely green screen.
I tried cleaning it with no luck.
So if any of you atari 8bitters out there have a WORKING CARTRIDGE
version of FORT APOCALYPSE, and are willing to part with it, please
make me an offer.

All the XF551s I've ever heard of were DSDD. However, Atari started selling them before DOS-XE was finished. A lot of XF551s were sold with DOS 2.5, and nothing in the documentation mentioned that it was actually a DSDD drive. If there actually are single sided XF551s, you might be able to just plug in an IBM compatible 360K mechanism.

From: Jeff_M_Lodoen@cup.portal.com
Message-ID: <84093@cup.portal.com>
Source record: 106215

I own one of each, guess I can answer your question.

Atari 800: 48k max (with Atari memory upgrades, I think the upgrades were standard near the end of it's run), 4 controller ports, slots for various peripheral cards (memory, 80-column boards), 10K OS (revision A and B), 2 cartridge slots, CTIA (later revised to GTIA) for graphics, video port.

Atari 800XL: 64k standard, 2 controller ports, NO slots, 14k OS [not entirely compatible with 400/800], 1 cartridge slot, GTIA, video port, peripheral buss.

Some 400/800 software is incompatible with XL/XE Operating System. They require a "translator" program. (translator is a misnomer, it's just a replacement OS)... Some programs won't even work WITH the translator, but very few are that tricky.

Jeff_M_Lodoen@cup.portal.com

]
]Purdue University Computing Center \\\

If Jody Lenn is still hanging around Purdue, you ought to go ask him.

Short of that, I'm sure you'll get plenty of answer over the net, many from those more knowledgeable than I, but I'm fool enough to start.

The 800 has two cartridge slots, while the 800XL has only one.

The 800 has four joystick ports, while the 800XL has only two.

Having said all that, I must say that very little software actually used the extra capability of the 800 in these areas.

The 800 requires a cartridge to speak BASIC, while the 800XL has it built in.

The 800 has no HELP key, but the 800XL does, not that much ever used it.

The operating system changed in subtle ways between the two, and some older software requires what is called a Translator to run on an XL. The Translator causes the XL to act like an 800.

The 800 comes with memory slots which were normally populated with 16 KB memory modules, making a standard, fully-populated 800 48 KB; while the 800XL comes standard with 64 KB of RAM. Both can be up-graded well beyond those limits with aftermarket or homebrew fixes.

I'm sure I'm forgetting something and will be duly corrected by the experts on the net.

Cross-posted to: comp.sys.atari.8bit,alt.folklore.computers

I just discovered c.s.a.8bit, and I'm glad I didn't miss this topic! I had a ball programming the 2600. Our development system was based upon a SIM single board computer replacing the CPU in the VCS. Program code was downloaded to the SIM by RS-232. I had remote debugging control that I programmed into an Atari 800, but the other developers at On-Line, who were using Apple computers, had only the SIM hex keypad and LED hex display for debugging purposes. Yikes...

The programming document posted here described available ROM as 6K, and yet there was supposed to be only 4K worth of address lines on the cartridge port. Every cartridge game I saw had only 4K of ROM space. There was 6K worth of address space available, but I don't think it was useable at the cartridge port. Our development system could use up to 6K, but we had to keep the code under 4K for final release.

The SuperCharger had 8K of RAM, bank selectable. This was an interesting trick, since the port doesn't have a R/W line. I know they couldn't use a STA instruction to write to cartridge RAM. I believe they synthesized a R/W line on the board as a latch from some decoded address. You would put the cart in write mode, and then either a LDA or STA would write to the RAM: The benefit they got from all this was really interesting. By moving the players and continually restuffing them, SuperCharger managed to create a full bitmapped 160x100 screen on the VCS! It saved the programmers a lot of bother by not having to write the tough display code.

Jawbreaker VCS was one of the most interesting pieces of code I've ever done. I still have it available if anyone has the ability to burn EPROM carts. It achieved single line resolution, and used 1.5K out of the 4K ROM, and about 112 of 128 bytes of RAM just to get a static display on the screen. It wasn't until a year after it was completed that I realized I could have cheated on the one scanline that caused me fits, and didn't have to update one of the players. Oh well...

My two favorite VCS quotes:

"The resolution is 160 by how fast your code is."

Ken: "How can anyone be expected to program that piece of s***?"
Me: "You're expecting me to program it."
Ken: "You're right. Made it good John Harris."

If you've ever wanted to use and offline reader with your 8bit and usenet, get your sysop to install Uqwk. Uqwk generates Qwk packets that can be read by offline readers like PabQwk and QwkSilver. To date I've only tested it with PabQwk (QwkSilver does not work with SDX). Does save a bit of online time and handles your email as well.

BTW does anyone else here use IRC?

st> The mentioned 'Uqwk' : Where is it available, and for what
st> system (Atari XL or PC)?

Uqwk is a UNIX QWK packet front end. It can be had from several FTP sites (you should get your local Sysop to pick it up and install it somewhere on the path). If you only have a limited time on the system, Uqwk will package the news leads you read (based apon you newsrc file), collect your email and download it to you to read offline on your Atari (or other system) using a program like PabQwk or QwkSilver. It saves a lot of online time by letting you brows messages rather than just flipping through them. When done, you upload the reply packet created by by you're message reader and Uqwk sends the replies to the correct news leads.

Your Sysop can get the C source by FTP to ftp.gte.com located /p

Well, I basically couldn't figure out how to come out and say it, after so long. So I figured I'd just confirm the first inquiry.

Yes, I'm John Harris, as in Jawbreaker, Mousekattack and Frogger, and I'm still programming the Atari 8 bit. I've been out of the main stream of public contact, but I'm still here. Most of the time I've spent doing character generators and related products for cable TV and similar industries.

I'm looking forward to sharing some experiences in the near future.

If I rember correctly, the 800XL, with its 64K was no differnt than the
800 with 48K- i.e. you couldn't use the extra 16k for anything except a
RAMdisk- there were maybe 1 or 2 (maybe 3) programs that specifically
onlt would run on an 800XL, and used the extra memory, but no game ever did.
So, you pretty much had only 48k being used.....

There were some games that used the extra RAM in the 800XL.. I can't
of any other reason 400/800 owners were kept from playing: Gauntlet
(the arcade game), The Eidolon and Tomahawk.. Among others.

The problem was to access the extra (over 48k) memory required the
OS to be swapped out... and I think 2K was always inaccessible.

You're mostly correct. I have a little program written by a small com-
pany here in Austin, TX, that runs as a TSR in that space. I load it
before whatever else I'm going to run (DOS, AtariWriter, whatever), and
I can hotkey into it at anytime. It gives me a small text editor, a map
of the Atari keycodes, a mini-DOS, and a calculator. It doesn't work on
an 800 because there's no memory there for it to run in. It works very
much like Sidekick on an MS-DOS machine, but some games defeat it because
they don't allow the hotkey to get through.

I finally got a copy of bobterm on an 8bit compatible disk for my 13 year old 810 and was planning on using it to upload all of my 8bit software onto my PC for archival purposes. I have an SX212 (spelling?) modem for my 800 but cannot get bobterm to recognize it. It is a 1200 baud modem manufactured by Atari with an SIO port on the back. I have been attempting to rig it up through the SIO port as I dont want to screw with an 850.

Any help would be appreciated.

Thanks

Kenneth L. Cope

Subject: Hardware Upgrades

I'm *REAL INTERESTED* in obtaining the following upgrades mentioned by Jeff
Popp (sorry I couldn't contact you directly, Jeff):

600XL monitor upgrade
600XL 256K RAM upgrade
1200XL video upgrade
130XE 320K RAM upgrade
130XE monitor upgrade

I'm hoping to devote an entire issue of AC to vvideo upgrades later this year.
Jeff, if your video upgrades are superior to those I've been working on, you
can earn a little money by submitting them as articles for AC.

In any event I would like to obtain copies of all 5 of the above. I'll be
glad to pay any reasonable price for the copies as you may require.

Subject: Battery Backup/XEP80

Hello Jim,

The gases given off by typical automobile/motorcycle rechargeable batteries aren't toxic. The chemical electrolysis results in the formation of hydrogen gas which is no more harmful than, say, carbon dioxide.

The problem with hydrogen is that it's extremely flammable in air. Like, explosive. You only need a spark to get a scene like the "Hindenburg" airship disaster. The battery should be kept well-ventilated, & don't go testing your new blowtorch around it (!).

There isn't a whole lot of software (unfortunately!) that makes use of the XEP-80. BobTerm 1.22 works well on it. AtariWriter-80 is an AtariWriter+ clone that also does well if you can tolerate the somewhat buggy interface (the bugs have pretty well been listed in the TnT column in AC the past several issues). MicroMiser wrote the best software for it. TurboFile, TurboBase, & some other giant business program whose name escapes me at the moment. Unfortunately none of these programs are available any more as MicroMiser dumped the 8bits beginning 1992. I run the AC subscriber database with TurboFile & (aside from one rather nasty bug) I really like it. It's absolutely the most powerful DB ever written for the 8bit. Wups... OK, I just remembered... TurboBase was MicroMiser's big business program, their other product besides TurboFile was TurboWord which is another XEP-80 wordprocessor. I don't have Turboword or TurboBase.

That's 5 programs (BobTerm, ATW-80, & the three MicroMiser programs). Anyone else know of others????

ATW-80 might still be available from one of the usual mailorder places that advertise in AC.

Look for a file named SX.COM on the Bobterm disk, and rename it to RS232.COM.

The 850 is the better way to go... You could use a null modem cable and
upload the files at 9600bps.

Either that or get your hands on a true double density drive and copy your
files to D.D, then use a utility like ATARIO on an IBM compat to read from/
write to the disks directly.

Hmm...let's see if I can help you more accurately duplicate the way I
have to do it. I first need to call a local site (which can only telnet
locally), in turn telneting to another site, which I use to telnet
to the site where my account is located. That could be the problem
in itself, but I never had problems with my SX212.

*Try this: Telnet to 128.101.83.1. To telnet from this site use:

crec telnet
Then try a Kermit transfer. If you have any problems, then I know it's
not a problem on my end.

2181. Need help using 'util.exe' for the PC

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-29 11:45:33 UTC
From: dfwright@sadis05.kelly.af.mil
Message-ID: <C9Dsny.J3p@sadis01.kelly.af.mil>
Source record: 106241

I've recently dragged my 130xe out of the closet, and have gotten several files via ftp from the archive. However, I cannot seem to get util.exe to transfer them properly to the atari disk. I have formatted the disk using the atari, with an old, old version of smartdos that I have, and also using util. Util starts to write the file, then says "bad path for (<nul>)", and only ends up writing one sector of the the disk. Any ideas?

2182. Amazing experiences with Atari & Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-29 13:21:52 UTC
From: winters@access.digex.net
Message-ID: <20pflg$4ui@access.digex.net>
Source record: 106240

Hello Atarians of the world: Before inquiring about some things, I would
like to first tell a little where I am coming from.... In 1982, I had
an Atari 800 with one disk drive. In 1988, a two year old spilled a
cup of fruit punch on my 800 - three days later when I noticed, the
keys moved like molasses. I never was able to clean that sucker off and
finally some smoke came out of it one day, due to a short. A year ago,
I got back into the Atari world and picked up an 800 for $35.00 A
disk drive was purchased for $15.00 along with other stuff, like games &
cartidges etc... I even got a pen plotter for $10.00!!! I thought to
myself, no way I can get any more disk drives or anything else this
cheap or cheaper... I was wrong - Sunday, I was in Laurel Md. at a
thrift shop and found TWO 1050 DISK DRIVES and a 800XL Atari computer for
$10.00 total. This morning, I hooked the disk drives up, daisy chaining
them - the manual is excellent in describing how to do this. After spending
2 minutes hooking it up, the disk drives (which were sitting in a pile of
junk for who knows how long, at the thrift shop), worked perfectly, with
the exception of the first drive moaning a bit. I have worked with many
different size machines over the years (PCs, Macs, minicomputers) etc..
and the "lowly" Atari 8 bit stuff is among the most reliable I have EVER
seen - I have seen people drop their disk drives, accidentally and they
STILL work!!! What do you think? Is $3.33 a disk drive, a good price?(:-) I have seen hobby
shops, which obviously have to make a decent profit)
sell used Atari disk drives for $25 to $100. Now, after getting this
junk out of my system, I have a few questions: Does anyone know of a
good C program for ATARI (public domain, shareware, commercial)? I
tried APX C and it took forever to compile.... Also, is there (don't
laugh :-)) a public domain "tiny-UNIX" avilable for the Atari?
Also, speaking of my one disk drive that groans, do those things need any
oiling? Any good recommended maintainance books on Atari Disk Drives?
Two more questions - has anyone ever networked 2 or more Ataris together?
Since I now have this second Atari machine, I was thinking of doing something
crazy like that - have a Atari Novell/Ethernet Lan! Finally, besides the
$100 or more option for getting a hard drive for the Atari, has anyone
figured out how to interface a standard PC cheap 20MB drive to
an Atari 800? It always puzzled me why Atari never saw fit to offer an
inexpensive hard drive for the Atari 800, since PC Hard drives can be
purchased for as little as %50.00. There are still thousands of
8 bit machines around that are working..... Look at the C64 - those
machines are still "hot" - how come Atari doesn't sell their 800s in
stores anymore? Oh well, I had to get all this out of my system....
I was happy to find this newsgroup - didn't think there was so many 8
bitters left!!! Any answers to my above curiosities would be greatly
appreciated.

It's called Genie (no relation to GEnie), and (if I recall correctly) was produced by New Horizons Software. I haven't seen a copy for sale anywhere in quite a long time. I bought mine at a clearance sale of some sort at a store down in San Antonio about a decade ago, and can no longer even find my original disk (I copied it and have used the copy for years), but I refuse to give it up because I paid REAL MONEY for it and find it quite useful, particularly when used with a word processor.

I just looked in the Austin phone book and see that New Horizons is at:

206 Wild Basin Road
Austin, TX 78746
(512)328-6650

If anyone wants me to call them and see if anyone there even remembers their 8-bit Atari days, let me know and I'll follow up.

C Compiler or "tiny-Unix" I don't know but I would like such a beast also.

> Also, speaking of my one disk drive that groans, do those things need any
> oiling?

I had a problem with my father-in-laws PCjr's disk drive groaning so I used vaseline on the 2 bars the drive heads traverse on and that fixed my problem.

> Two more questions - has anyone ever networked 2 or more Ataris together?
> Since I now have this second Atari machine, I was thinking of doing something

I myself was looking for a way to do this and found a book, can't remember the name, but I used ideas from this and used thr R: handler in the Bobterm package and I was able to communicate from an 800xl to an 600xl and back --- no problem, I will post when I can get the info.

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).
I will respond to every e-mail message I get here (if you get no response,
please try again). PLEASE FEEL FREE to make any offer! I intend to finalize
sales within a few days, and will accept immediately offers that look very good
(if there will be any).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Printer- Epson RX-80F/T in excellent condition, extra ribbon.
Printer- NEC 2050 letter-quality personal daisy wheel wide carriage-
this is a smaller, personal computer model, NOT the heavy office model.
Monitors-
1. Commodore 1702 color monitor, one of the best color monitors
available. In mint condition.
2. 10" color monitor with composite video and sound.
3. Green monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.

Atari CX853 16K RAM memory module for Atari 800 (I have 2 units)
Axlon RAM CRAM 32K memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
MPP CARD?/AT centronics parallel printer interface (hooks up a standard parallel
printer to Atari I/O port, no need for 850 unit).
Atari power supply model # C061982 (for the XL/XE series I think).
Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)

Atari 1010 Program Recorder - I have 2 units, Work fine.
Atari 1010 Program Recorder - save: ok, load: no.

4 DISK DRIVES-
2 Atari 1050 drives, 2 Atari 810 drives, all sold as is.
They had various levels of problems, the 1050 spins and the light comes up
but it won't load, and one 1050 and one of the 810 were dead as I recall.

A pair of Atari radio remote control joysticks-
purchased used and never tested by me, because
I do not have the 9V batteries needed to operate them, sold "as-is".
Cosmetically they look very good, though.

***** SOFTWARE *****

Cartridges-
==========

BASIC (CXL4002) with manual
Centipede with instructions
Missile Command
AtariArtist cartridge
AtariWriter Wordprocessor with manuals and original box

Disks- (All are original disks)
======

Lode Runner with manual and original box
TimeWise with manual and original box
Epyx Summer Games with manual and original box
Strategic Simulations Inc. Computer Baseball with manual and original box
Temple of Apshai with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Pinball Construction set with original binder and manual
Infocom Zork I with manual and original box
Micro League Baseball with manual and original box
Micro League Baseball General Manager/Owners Disk with original box
Atari Translator
Ghostbuster by Activision
CONAN (Datasoft)
Computer Baseball
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 100 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
Joystick Sketchpad with manual (used)
apx Eastern Front 1941 (with manual and original box)
Thorn EMI Compute 4 and Reversi (in original box with instructions)
Thorn EMI Snooker and Billiards (in original box with instructions)
Atari Statistics I (with manual and original box)

Books-
======

Bill Carris- Inside Atari BASIC
Gardner- Software Protection and Code Breaking (book only)
ICD SpartaDOS Construction Set
Your Atari Computer
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

I wholeheartedly encourage those people to port the STXformer to the AMIGA.
But I just hope they use the custom chips in the amiga correctly.
ANd not just port the C code.

2190. CD ROM and FLOPTICALS

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-30 03:42:20 UTC
From: G44@delphi.com
Message-ID: <01GZYVPD4UTK91WV02@delphi.com>
Source record: 106251

Would anyone like to comment on the possibility of using CD ROM and FLOPTICALS with the Atari?
There is a CD ROm thread on FIDOnet.
Seems it would work best outside of DOS, and only copy from, and not RUN from it.
This would be if the handler or DOS patch was too complex, which it may be.
Besides, using an L: device or something would not eat up a drive number.
Flopticals would be cool too, and Puff said there isn't too much needed to add them.
Or at least I think he did...
The thing is, they use 34 pin floppy connectors I believe, not SCSI.
So it would probably require a Floppy Board update.
The ROM I mean.
Then when you swap to it, you are dealing with either a 16 meg partition with 5 megs wasted, or
an auto-swap in of 2 partitions, like 10.5 megs a piece or something.

Any ideas or projects in the works?

2191. Atari 2800

Message-ID: <Jeff_Mcwilliams.0idv@abcd.houghton.mi.us>
Source record: 106254

Okay, well, the best way to hook up a hard drive would be via
one of three interfaces for you 800XL, the C.S.S. Black Box,
the MIO from ICD, of the Supra Interface now being sold by
K-Products. All of these devices offer a SCSI port for connecting
SCSI drives directly, or MFM/RLL drives with a SCSI<->MFM/RLL
controller in between. Bob Woolley has been working on an
8 bit IDE interface, but having shamefully allowed my SLCC membership
to slide, I've not heard much about it for a while.

Networking: Look into the Multiplexor from C.S.S., connects via the
cartridge port. Allows printer sharing, floppy/hard drive sharing,
and has support for sending messages from one "networked" computer
to another. With a little programming on your behalf, you could
build an atari network in your home, with email server, a unix like "TALK"
mode, and whatever else. SpartaDOS X and SpartaDOS 3.2d are MSDOS like,
and are thus closer to UNIX than anything else we have. Both support
subdirectories, batch files (sorry, no csh or tcsh scripts here),
and IO redirection via the >> and << operators.

There was a thing called MTOS which did multitasking, but it was sloowww.
There is another program called snapshot, which basically sets up
several virtual 8 bits on one expanded 130XE/800XL/1200Xl machine.
It's a single tasking system, more like a task switcher.
Sorta works like iScreen for UNIX, except that I think ISCREEN also
allows each window to continue running even though it's not active.

What else were you asking about? I can't remember. Oh, the Multiplexor
does not allow sharing of RS232 ports, and therefore, modems.
Each computer needs to have its own RS232 port & modem if you want to
be able to dial out of your house no matter which computer you are on.

Source record: 106305

Glenn,=

Tom Hunt is into CD ROM stuff, in fact I think that's his job, or something
to do with it anyway. On one occasion we talked about CD ROM interfacing.
The big problem according to him is that most CD ROMs use 1024 byte
sectors, as opposed to 512 bytes supported on the BB, or 256 byte
sectors supported on the MIO and K-P Interface. So that alone would
require a rework of the firmware/hardware in your SCSI adaptor.

Then of course, what ya gonna do with a CD ROM version of Grolier's
Encyclopedia. This stuff has graphics images, sounds, and all sorts
of stuff on it. Apple versions come with Quicktime formatted
video/audio don't they?

Flopticals. I think you are talking about the 21 meg ones. These
are SCSI devices. Don't get confused just because they also read and
write 720K and 1.44 meg diskettes. In fact, if you could do it,
I would think that a floptical reading an 8 bit floppy over the SCSI
bus would be faster than a Black Box/Floppy board reading the same disk.
The Floptical drive makers say these babies read floppies 3 times faster
than your standard Shutgart (spelling?) floppy drive.

Now, then there is the issue of can we also get these drives reading
MSDOS formatted disks? All the hardware is there, you would just need a
utility similar to the MSDOS disk reading utility for the Black Box
Floppy Board, or the C.S.S. XF551 upgrades.

I am still looking at the IOMEGA version of the 21 meg flopticals.
I sorta feel that SyQuest and Iomega are the top guns in the removable
media areas like hard drive cartridges and floptical drives.
Iomega floptical drive ads claim their drivers are better than other
manufacturers who produce these Floptical mechanisms. By the way,
"Floptical" is TM Insite systems. A manufacturer gets the fancy
"Floptical" logo on their drive to show that their mechanism meets the
minimum specs in accordance with whatever Insite came up with.
From what I read in Pc Magazine or somewhere, Iomega took the Insite
specs and improved upon them when they built their Floptical drive.

2196. COMEBACK FOR ATARI?

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-30 17:41:00 UTC
From: MIS0160@MVS.UDEL.EDU
Message-ID: <19930630124111MIS0160@MVS.UDEL.EDU>
Source record: 106308

The following paragraph appeared in the business section of our local newspaper (The News Journal, Wilmington Delaware) this morning:

COMEBACK FOR ATARI? Atari Corp. and IBM have agreed to a new $500 million partnership to produce a new and advanced entertainment system. The Jaguar system is Atari's attempt to leap back into a video game market dominated by Nintendo and Sega. Atari was once a video game maker powerhouse. But last year, it reported a $73.6 million loss.

I remember reading about the Jaguar system in the latest ZNET magazine. As I recall, it uses a 64-bit processor. With Big Blue backing this venture, hopefully it will get past the vaporware stage.

IMHO, the way to do this would be to use the SIO2PC interface, and let the IBM
do the networking. W/O much effort at all you could get a number of atari's
sharing disks & printers, and with some code hacking you might develop an
n: device driver, that would pass "packets" out the SIO, that would be grabbed
by the SIO2PC software, that would spit the packets out on the net.

is the source for the SIO2PC program available?

About networking 8bits: a good (cheap, but somewhat fast) place to put a network is the joystick ports. It's as simple as getting two joystick cables and connecting the grounds and the four direction switches together. You could also be a little more sophisticated and find a way to use some of the other lines.

Then write some simple software to do communication/handshaking. When I was experimenting, I wrote the send/receive software in assembly in about an hour, and got some performance out of it. If I had used better protocols, I could probably have gotten ~50kb/s. (BTW, don't ask me for this software: it wasn't very good and I lost it anyway...)

You can also get your 8bit to act as a 'virtual joystick' for another 8bit or a 2600... I don't know if that is useful, but I've done it :-)

Later,
Steven Ourada

Message-ID: <1993Jun30.220305.27285@dcc.uchile.cl>
Source record: 106313

Hola mundo.

I've decided to use this utility to transfer files to my 8bit.

In the .ARC file, there are the sources of the program.
The .C file has a control label that can be changed in order
to use the 1050 enhanced density.

Had someone tried it?

Also, the docs says that only the MYDOS format is supported.
Is that true? (I must download MYDOS first ;-)

Thanks... ++V

Gm>What is the status in obtaining the rights to MICROMISER 8-bit items?
Gm>8-bitters suffering because the best hardware and software
Gm>was either NEVER MADE or made in small quantity and unobtainable any longer is the
bane of our platform
Gm>nd pisses the sh*t out of me.

Hay Glenn...why not call them and make a proposal to buy their 8bit package
If you feel that strongly about something don't you think you should do
something to fix the problem. ICD offered their right and I sent Tom a
proposal, have yet to hear back from him and will be calling soon but at
least I'm willing to take the financial risks involved in trying to acquire
8bit rights with little or no market left...Damn few others are willing
to make the effort, I guess it's easier to complain and pirate than to
get up, take a risk (from folks who'd rather steal something than buy it)
and do something productive....

I can already hear the replys coming...and if you don't already know how
dumb that is; is it any wonder Atari is where it's at today?

2202. RGB monitor for 800

Newsgroup: comp.sys.atari.8bit
Date: 1993-06-30 23:25:41 UTC
From: tzb76@isuvax.iastate.edu
Message-ID: <C9GJqu.DAv@news.iastate.edu>
Source record: 106314

I just got a BARCO RGB monitor, and tried to hook it up to my
atari. I had, in the past, hooked a composite monochrome monitor up
to it via the 5 pin din on the side of the 800. I took one pin to be
ground, one pin to be a video signal w/sync, and another pin to be
the sound. As this leaves only two pins remaining, I asumed that they
and the pin I had been using for the monochrome monitor would be
RGB output. Whats confusing me, is that one of these video outputs seems
much stronger than the others, and that two pins seem to have a sync
signal, but the thrid doesnt, and the colors seem odd.
Correction, the colors are odd; unsatisfactory. Can someone
please explain to me what all the pins on the 5pin din are, or if
the atari DOES produce a standard RGB signal?

Paul Thompson

Greetings

I was wondering if anyone has developed/found a home made modem interface
, for the 800XL, which can connect to any resonable speed
modem on the market. I wish to download from the archives but
here in NZ it is virtually inpossible to get atari hardwear
(Even second hand) so the 850 or P:R: is out.
I can handle most circuits and have access to a local DEC Station so ftp
here is not a problem, just can't get it to my computer.
Any help greatly appreciated.

Also is there a FAQ file on programing the 800XL PBI at the archives?

Thanks in advance.

This is something I have been wondering about for sometime, is it realy that easy? just connect the appropiate pins to their counterparts on the other computer? There is no chance of blowing anything is there?
I mean, say if you were to write the software to do this, and there was a bug in it, and you happened to send a signal down the same line at the same time from both computers, would anything blow?

2209. 8-bit Atari Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-01 12:44:56 UTC
From: MCURRENT@carleton.edu
Message-ID: <01H00QVTDHUQ8WWA0F@carleton.edu>
Source record: 106321

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 16-Jun-93

Additions/comments/corrections having to do with this FAQ List are
welcomed by its creator and maintainer, Michael Current, mcurrent@carleton.edu.

The 8-bit Atari FAQ List is posted on or about the first of the month to
the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many commonly
asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group. At this time the FAQ List is heavily geared toward describing the
various resources for the 8-bit Atari user available, with relatively little
information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. Hence no automatic
archiving of this FAQ List occurs, though there's usually a fairly recent copy
on the Atari Archive (see below) as the file 8bit/faq.txt.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
rec.games.video.arcade (includes products by Atari Games)
rec.games.video.misc (includes Lynx)
rec.games.video.classic (includes 2600, 5200, 7800)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the
Internet side of this discussion group. All contributions to the Info-Atari8
Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is
maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to
info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on
Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be
cross-posted to the Usenet side. John Dunning would like this fixed, but needs
help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the
Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to
info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
atari.archive.umich.edu is the Internet site which contains many files for
the 8-bit Atari computers. Our 8-bit Atari Archivists are John Dunning,
jrd@atari.archive.umich.edu, and Jody Lenn, lenn@atari.archive.umich.edu.
The Atari Archive as a whole is maintained by Jeff Weiner,
weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP
a) FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4)
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1)
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to:
atari@atari.archive.umich.edu. The subject of the message doesn't matter, but
let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your Gopher server doesn't provide a path to atari.archive.umich.edu, try the command:
gopher gopher.ius.itd.umich.edu

4. AFS
If your system has AFS capability, this is the easiest way to access the Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files (.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file describing what your upload is, so our 8-Bit Archivists will be sure to place it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to weiner@atari.archive.umich.edu. Please name the parts in the subject line. This is really helpful as the parts usually don't arrive in the proper sequence. Also, please include a message labeled "file transmission," containing a short description of the file, etc. Shar files are also acceptable, but uuencoded is preferred. It is especially important to specify that your upload is for the 8-bit computers, since most of what Jeff receives is for the ST/TT/Falcon.

3. AFS
If your system has AFS capability, this is the easiest way to upload to the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to retrieve any files available from anonymous FTP sites on the Internet, including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of your message says:

help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it
is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Free-Net via modem at (216) 368-3888. Those persons
with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts
are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG user directories are automatically
members of the official Atari user group CAIN - Central Atari Information
Network. Send correspondence and press releases to xx004@po.cwru.edu.

What product developers or vendors support the 8-bit Atari?
See the companion frequently posted text file, "All Known World-Wide 8-Bit
Atari Vendors and Developers" for complete information.

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note
that most require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Filename:
8bit/Diskutils/dskutil.arc

(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

What are the pinouts for the...?

850 Interface Module

From: generic@rahul.net (Chris Rosenthal)
850 Interface Module, serial: (R1-R4)
R1:
Pin 1 Data Terminal Ready (DTR, Ready Out)
Pin 2 Carrier Detect (CRX, In)
Pin 3 Send Data (out)
Pin 4 Receive Data (In)
Pin 5 Signal Ground
Pin 6 Data Set Ready (DSR, Ready In)
Pin 7 Request to Send (RTS, Out)
Pin 8 Clear to Send (CTS, In)

R2:
Pin 1 DTR
Pin 3 Send Data
Pin 4 Receive Data
Pin 5 Signal Ground
Pin 6 DSR

R3:
Pin 1 DTR
Pin 3 Send Data
Pin 4 Receive
Pin 5 Signal Ground
Pin 7 RTS
Pin 8 -8 Volts

R4:
Pin 1 Send Data +
Pin 3 Send Data -
Pin 7 Receive Data +
Pin 9 Receive Data - (20 mA)

Map of connector is:
5 4 3 2 1
9 8 7 5

From: Jim Evans, donor@max.u.washington.edu
850 Interface Module, parallel:

8 7 6 5 4 3 2 1
15 14 13 12 11 10 9

1: Data Strob
2: D0
3: D1
4: D2
5: D3
6: D4
7: D5
8: D6
9:
10: Data pins pull up + 5v
11: Ground
12: Fault
13: Busy
14: -
15: D7

[Pinouts for all ports on the 8-bit, plus the XEP80, should be added.]

End of FAQ List.

>smartdos that I have, and also using util. Util starts to write the
>file, then says "bad path for (<nul>)", and only ends up writing
>one sector of the the disk. Any ideas?

I'ts been a long time since I've used UTIL (though that's probably on tap
for this summer). Are you using the latest version,
8bit/Diskutils/dskutil.arc?

It sounds like you're not putting in the correct drive or path
specification for either the source or destination file.

How compatible is SmartDOS to MYDOS? Did you format it in SS/DD 180K, as
required by UTIL?

Just a couple ideas..

S(B>>> Two more questions - has anyone ever networked 2 or more Ataris together
S(B>>> Since I now have this second Atari machine, I was thinking of doing
S(B>>> something crazy like that - have a Atari Novell/Ethernet Lan!

S(B>IMHO, the way to do this would be to use the SIO2PC interface, and let the
S(B>IBM
S(B>do the networking.

Back when I owned a 320XE and an 800, I created a poor man's network by sharing all the SIO devices between the two machines. I made a simple switch box based on a mod published by an Iowa user group.

The box plugged into the "master" computer's SIO. There was another input from the "slave" computer's SIO. Finally, there was an output for the SIO daisy chain of devices. All the SIO lines from the two computers were connected in parallel with the exception of the +5v and I believe the 'command' line. The 'command' line from each computer was run through a double pole, single throw toggle switch. The +5v line was only connected to the "master" computer.

The "master" had to be turned on for either computer to access the SIO chain. By flipping the toggle switch, either computer could access the SIO devices. One computer could write a file to the disk drive, flip the switch, and the other computer could read the file.

If you want certain devices to always be available to only one computer, simply put it into the daisy chain before the switch box.

On my setup, the 320XE (master) booted with SDX and had a MIO and hard drive, with a hard drive partition assigned to logical drive 1. Physical floppy 1 (XF551) was assigned via the MIO to logical drive 2.

Since the XF551 was physically drive 1, I could flip the switch to the 800 (slave) and boot the computer using an older version of SpartaDOS, MYDOS, or DOS 2.5.

I could run TextPro+ under SDX off the hard drive on the master and save the file to drive 2 on an AtariDOS format disk. Flip the switch to the slave which was running Daisy Dot, and print the file on drive 1 (same physical drive - didn't touch the disk) to my Atari XMM801 dot matrix printer. Meanwhile, I was free to do whatever I wished with my master.

I'm sure you can think up many more useful examples where this setup would be helpful, such as editing an image using the best features of two graphics editors...

Since I've had some small level of interest by e-mail in the TSR pro-
gram I use (Genie), I called New Horizons Software here in Austin to
see if anyone there even remembers their 8-bit Atari days.

I called and spoke to Randy Brooks. He said that James Bayless, who
still works there, wrote Genie as his first commercial program, and that
they followed that with a recipe filing program for the 8-bit before going
over to the Amiga and Mac. He checked and said that they still have a half
dozen copies of Genie squirrelled away that they would be willing to sell
if they can just figure out how much to charge. I am to call back this
afternoon to speak to James and will let you know what I find out. Their
address for e-mail is:

76004.2021@compuserve.com

In fact, if any of you 8-bitters out there is interested enough in this
program to want to revive it and publish it, my guess is that New Horizons
would entertain any reasonable offer just to get SOMEthing out of it.
Randy seemed quite amused to be getting a call from an 8-bitter after all
these years.

WRONG! MANY programs (Qui<k, TurboBASI@ XL, many demos, many games) only
work on the 800xl due to the "under the OS" 16K of RAM. Oh YEAH!,
SpartaDOS, too! (that's why SpartaDOS and TBXL, for example, don't work
together).

Unless you're talking about something else... I must say you're wrong.

I do not prescribe pirating until all other options are explored.
But if I want to use X software package, and there are only X number left,
I have no choice but to pursue a method of copying.
I would much rather pay a fair share, like whatever Micromiser wanted for their software.
But if they won't sell it, I can't buy it, and I don't have the money even to put up a pitiful offer.
I just spent $80 buying MIDITRACK III from B&C so I do support the suppliers.
But if worse comes to worst I will not hesitate to pursue a copying method since the bottom line is I want the
best there is for the 8-bit, whether the company will provide it, or not.
I only use it as a means to obtain software that I would NOT be able to obtain in any other way.
If someone will post the address to MICROMISER I will appeal to them to either make another run,
or to make a "special allowance" in my case.
Perhaps we can convince them to make one more run of disks.
Then, now that more people are aware of the programs' quality, those who want it can get it one last time.
That is the best solution I can come up with outside of pooling money to buy off the rights.

G4> But if I want to use X software package, and there are only X number left,
G4> I have no choice but to pursue a method of copying.

Glenn this is a dead end argument, the way you see things is that if its not made anymore then what the heck, no one must own it so I'll just copy it (steel it, forge it, take it).

You know when you run off at the mouth about how you're not afraid of anybody and what they may or may not do, all you do is add one more shovel full of dirt to the Atari grave. Its reasons like that why owners of Atari program rights don't have the slightest interest in producing for the 8bit...and if you think people like Tom Harker (ICD) or the folks that now hold the Datasoft righs didn't see that idiocy you posted, then you're a bigger fool than I thought you were. And we can still talk 'em into supporting us? You know what your next argument for coping their software will be...the cost. That kind of bullshit goes back to 82, not one damn thing has changed. And if by some odd piece of luck I do acquire the ICD rights, will you steel from Me? How about if I don't produce what you want fast enough, drop something or just charge a price you feel is "TOO" high to be fair....

Yeah, you say I'm being to hard, taking it to personal, picking on you...Well I'll let you in on something, I've got proposals going out to many copyright holders trying to acquire the rights to a number of different programs. What are you doing besides talking about steeling....

Glenn, you do us all proud.....

Source record: 106338

Bill,

Yup, there is a BIT in PORT B that you set or clear to enable/disable
the ROM. The MMU I believe is responsible for looking at this setting,
looking at the address BUS, and deciding which to put online, the
ROM or RAM.

There is a thing known as the Babylon upgrade (after the guy who
made it, not because it comes from Sumeria) which is basically a write
protect switch for the OS RAM. That way, you could put in a RAM based
OS, and nasty, bad programs couldn't clobber it because you've write
protected that region of RAM.

Well, this is sort of okay I guess, but isn't really helpful for running
a modified OS under Sparta 3.2d or TurboBASIC XL. Also, a bad nasty
program can still re-activate the ROM instead of the RAM, essentially
disabling your modified OS anyhow.

A better idea is to supplement the ROM with a 32K Static RAM, and
slap in a 2nd PIA chip into your computer. Now, a PORT C would be
responsible for write protecting, the Static RAM, and making the STATIC
RAM appear instead of the ROM. This is a much better way to go,
because you can run a RAM based OS AND SpartaDOS 3.2d, TB XL, whatever.
The reason, the Static RAM takes the place of the ROM, and Port B still
allows you to enable the Dynamic RAM beneath the Static RAM.
What's better, since SRAM comes in either 8K or 32K, and you need 32K,
you essentially have two banks of 16K RAM in the OS region (minus
the Dx00 region, which is mapped to hardware and PBI I/O).

The only thing that irks me about throwing this upgrade into my 1200XL
to see how things go is the UltraSpeed Plus OS. This isn't your ordinary
27128 type ROM chip, as any of you other US+ owners know. There is extra
stuff in there, and wires going to strange places. It might now be
possible
to copy a US+ into RAM, and modify it, say to use Port D of PIA #2 as a
Printer port, modifying the OS ROM P: handler to do so, if the US+
does strange things internally. I'll have to see. This project is
due to be something I dig into once I move, which is what I'm in the
process
of doing at the moment.

Whoops, replace "It might now be possible" with "it Might NOT be possible"
This editor stinks, it's what I get for accessing USENET via an AMIGA
host computer which only has a simple editor for us non-ANSI users.
(frown)

2227. ScotchDOS

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-02 07:35:03 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <5wu26B2w165w@cyberden.sf.ca.us>
Source record: 106341

WELL.....

Re: ScotchDOS

Ok, for those of you who don't know what ScotchDOS is, it's this:

A CLI program meant to replace DUP.SYS
It works with MyDOS, supporting subdirectories,
external commands,
batch files,
parameter passing (thru page 4)
variables and strings
"IF"-type processing,
other stuff...

My problem.. it's a HECKUVA program to work on... at least to make it as NICE as possible. This is "NICE" as in COMPATIBLE. I HATE to say it, but I THINK <gulp> I may have to resort to saying "you need a RAMdisk to use this."

Why? Well RAM isn't exactly lacking in our little 64k machines (48k, I'm NOT NOT >NOT< going to go under the OS! SORRY! ;)). HOWEVER, RAM is USED! Programs use RAM, programs overwrite RAM, and, well, it's just a pain in the rear. I may almost decide to stop using page 4 RAM for parameter passing. Why? Well, maybe, JUST MAYBE, there's something out there that, even nowadays, USES page 4 RAM!?

Now, why should I use a RAMdisk? Well, it'd be slightly easier on me (as if I can't write another Action! routine that "pretends" to INPUT, just as a RAMdisk handler "pretends" spare RAM is an accessable drive).

Do you get my drift? Rather than storing a bunch of hideous stack data parameters and the like in any little rarely-used corner of RAM (like page 4), I'll just store it in a little file right on your D9:...

"Why am I forced to use a RAMdisk!? (ahem, or hard drive.. anything with speed and that is static.. ie, D1: won't do, because you might remove the disk.. besides, it's S L O W! (heh, well, at least my 1050 is ;)))"

BECAUSE!! - most of us HAVE RAMdisks... (thank god I do now ;))
What's the point of using a spiffed up application like ScotchDOS to run a bunch of nifty external programs and batchfiles and the such when you have to WAIT so LONG for the drive to spin? So... people w/o RAMdisks would most likely not WANT ScotchDOS, so why not go all the way and say you NEED one!?

I'll do it this way (god, I love MyDOS ;)):
you set up from CONFIG.COM (yuk!) or the MyDOS menu with "O"
... set up your RAMdisk, etc.
you write your DOS files to a boot disk/drive
you replace DUP.SYS with ScotchDOS (aka another DUP.SYS)
you set up a ".AR0" file (hell, I'll make a nifty one) which
formats your D9: RAMdisk (who uses D8: anymore???)
you might set up a ".AR1" file which would copy RAMdisk files
(yeah, yeah, sure, sure, use some RAMDISK.COM to do the
above two things... I dont have a good one I like..sorry)
you reboot...
Here's what happens:
DOS.SYS boots- MyDOS gets installed, your RAMdisk is
installed to it's proper size
*.AR0 boots- your RAMdisk is formatted
*.AR1 boots- your DUP.SYS, MEM.SAV (who uses THAT?!), etc
is copied to D9: (and DOS is told that DUP
is on D9: (I still have to figure out how to
do that...where's my TECH.DOC!?)
DUP.SYS boots- you're in ScotchDOS (the CLI)
It might run some AUTO?.BAT file (spiffy)
You're in the CLI

Is this adequate? Who has a GOOD arguement against using a D9: (or some
other drive (hard drive?)) as a place for files like "STACK.SYS" and
"PARAM.SYS"(?).....

(BTW- Stack will be used to handle batch files and the like..ik)

Ok?

|>

I think (hopefully) Glenn's real argument is about availability of the software. For example, it doesn't do him (or anyone else) any good if the rights to software package X are owned by John Doe living in some far off country. If that piece of software is not being made commercially available, then what is Glenn to do???

Along those same lines, why would someone wish to own the right to a piece of software and NOT make it available for sale??? Isn't that the purpose of owning the rights in the first place... making a buck from the product?

If someone owns the right to a piece of 8-bit software and doesn't at least make it known to the 8-bit community, there is very little chance of anyone asking them for a legitimate copy. Better yet, the holder of the rights could get the software duplicated in small batches (using minimal packaging), and actually advertise it in the few publications left for the 8-bit. What a novel idea... letting the prospective customers know that a product exists!

Mike, I am curious as to what packages you are working to acquire the rights too? If you get the rights, are you going to distribute the software commercially?

You can't compile/link it W/O the .ASM file converted to the .OBJ file for one thing. I recently got a copy of MS MASM & generated the .OBJ file for fooling around & no go. I've tried linking it with both the Turbo C & MS Optimizing C Compiler & haven't had any luck. But then, I'm satisfied with Mule <g>.

>could get the software duplicated in small batches (using minimal packaging),
>and actually advertise it in the few publications left for the 8-bit. What
>a novel idea... letting the prospective customers know that a product exists!
>
>

Okay, What's Glenn to do you ask, as much as I hate to say it he'll just have to live with it (that is if he's honest). Look you can't get Tuckers anymore...there just not around but I bet if I started making 'em I'd find my ass in cort faster than the real Tucker did...See the point yet.

The trick is, someone still own's those rights. Don't you think it's worth the effort to talk to these people before you start telling everyone in the world your going to steel from them...And after you've come out and told them and everyone else that you're not afraid of anybody and will make copies at will anyway, you still expect these people to want to invest in producing, printing, mailing, and advertising a product you'd already said you take anyway and to hell with what anyone else thinks...Yeah right.

At this time in the 8bit world, I'd expected people to be a bit brighter than that, I would have hoped that all the little kids would have droped out or moved on to steeling from the IBM world by now. I see I'm wrong.

It must be just me...because you just don't get it. These same people still walk around today with their cracked wares, bootleg copies and Xeroxed manuals and still spout the same lame lies..." I wouldn't a bought it anyway so they aint losing anything, sides they charge too much...if it was 10 bucks I might buy a copy...." Bull.

And somehow you feel that steeling somthing (just because it's no longer produced) is okay...Using that logic I should just walk over to the comp. lab and take those Mac Pluses (new in the box) because, hell there not made anymore and I can't get 'em, so I guess I should go take 'em because I can sure use 'em...Yeah it's a bit of a reach but it still adds up to the same damn thing...And you still don't get it do you.

I hate to break "Real World" news to you but there almost isn't any money to be made in the 8bit world. Yeah you can point to the few Co. still selling pre package commerical software and two that still produce hardware, but ask 'em what there bottom line is...Talk to shareware authors like Tom Hunt, Pab Sungenis, Tom Andrews, Bobby Clark, and Ronnie Riche and ask 'em how well they did. Maybe 10 people reg'd with Pab and only a little over a hundred reg'd with Ronnie over all the years he supported TextPro...Yeah there's a real buck to be made there...And you still don't get it do you...

Just off the top of you head, what do you think it costs to buy someone's software rights. How about production...(Distrib's like B&C order rather large quants). Mailing? Advertising? How about protecting your name and investment (you'll likely have to incorp. for that) How about protecting yourself from people who just think you charge too much for an old system and just steel your stuff because, what the heck I wouldn't have bought it anyway so your not losing anything....And you still don't get it....

There's no grey area here...only a right and a wrong period.

You ask, who am I talking to... As it is with many things I really can't and won't say until the deals are further along...just good business. Will I distrib the software I buy the rights to? Hmmm, no I think I'll just invest large sums of money in to setting up a corp. and acquiring the rights just to set to set 'em on my shelf and see how nice they look by firelight. Come on, what do you think... Ask another question like do I plan on making anything at all from this...The answer to that one is NO.

I could go on... But what7s the point, you don't get it. You have your one selfish narrow minded point of view. If you can't see what I've been getting at, if you can't see the result of just that kind of thinking in the past then why waist my time, effort, and monies on a bunch of losers like you. Maybe your right, just go steel what you want...You'll make the good folks at Power Per Post feel really great about coming into this country with new software titles....And you still don't get it.

2232. MAKE.MONEY.FAST

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-02 19:56:53 UTC
From: aj008@cleveland.Freenet.Edu
Message-ID: <2123u5$2fk@usenet.INS.CWRU.Edu>
Source record: 106343

INSTRUCTIONS

Follow these instructions EXACTLY, and in 20-60 days you will have received well over $50,000 in cash, all yours. This program has remained successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions.

Welcome to the world of MAIL ORDER! This little business is different than most mail order houses. Your product is not solid and tangible, but rather a service. You are in the business of developing mailing lists. Many large corporations are happy to pay good money for quality lists. (The money made from the mailing lists are secondary to the income which is made from people like yourself requesting that they be included in that list.)

1) IMMEDIATELY mail $1.00 to the five names listed below, starting at #1. Send cash only please (total investment on your part is $5.00). Enclose a note with each letter stating:
"Please add my name to your mailing list."
This makes it a legitimite service that you are requesting and you are paying $1.00 for this service.

2) Remove the name that appears number 1 on the list. (After you send the number 1 person a dollar) Move the other 4 names up one position. Making #2 now #1, #3 now #2, and so on. Place your name, correct address and zip code (or postal code if outside the US) in the number 5 position.

3) Post the new letter with your name in the number 5 position into 10 (ten) separate bulletin boards in the message base or to the file section, calling the file, MAKE.MONEY.FAST.

4) Within 60 days, you will receive approximately $50,000 in CASH. (Amounts will vary, of course) Keep a copy of this file for yourself so that you can use it again whenever you need money again. As soon as you mail out these letters, you are automatically in the mail order business, and people are sending you $1.00 to be placed on your mailing list. This list then can be rented to a list broker that can be found in the Yellow Pages for additional income on a regular basis. This list will become more valuable as it grows in size. This is a service and it is perfectly legal. If you have any doubts, refer to Title 18, Sec 1302 & 1341 of the postal lottery laws.

NOTE: Make sure you retain EVERY name and address sent to you, either on computer or hard copy, BUT do not discard the names AND NOTES they sent you. This is proof that you are truly providing a service should the IRS or some other Government Agency question you.

Remember, as each post is downloaded and the instructions CAREFULLY followed, five members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the number 1 position, you will be receiving thousands of dollars in cash.

NOTE: Always double check the address you've written on the envelopes to make sure they match the list. Small errors could lead to improper delivery.

Here's a letter that was written by a participator in this program:

To whom it may concern,

About six months ago I received the enclosed post in letter form. I ignored it. I recieved about five more of the same letter within the next two weeks. I ignored them also. Of course, I was tempted to follow through and dreamed of making thousands, but I was convinced that it was just another gimmick and could not possibly work. I WAS WRONG!! About three weeks later I saw this same letter posted on a local bulletin board in Montreal. I liked the idea of giving it a try with my computer. I didn't expect much because if other people were as skeptical as I was, they wouldn't be too quick to part with $5.00. But, I buy lottery tickets weekly in my province and have nothing to show for it other than used ticket stubs. This week I decided to look at this as my weekly lottery purchase. I addessed the envelopes and mailed out $1.00 in each just as directed. Two weeks went by and I hadn't received anything in the mail. By the fourth week, I couldn't believed what happened! I can't say I received $50,000, but it was WELL OVER $35,000!! For the first time in over 10 years, I finally got out of debt. It was great! Of course, it didn't take me long to go through my earnings, so I am using this excellent money opportunity once again. Follow the instructions and get ready to enjoy.

Please send a copy of this letter along with the enclosed letter so together we can convince people who are skeptical that it really does work!

Good Luck,

Charles Kust
St. Agathe, Quebec (CAN)

From: rac@sherpa.UUCP
Message-ID: <C9K2D0.Cx5@sherpa.UUCP>
Source record: 106344

I recently was given a couple of non-working Percom drives. There was
no documentation included so I have no idea what they are. Can someone
provide the details? Are they single/double sided, single/enhanced/double
density, etc. The specifics are:

model AT88-S1PD (has several rows of what appear to be jumpers; how are
they used?)
model RFD4051 (has four dips on back; what are they for?)

Lastly, is there anyone who repairs these drives should they be worth
repairing?

Thanks for any help.

Source record: 106349

I wish to point out a few things Mike may not agree with.
The copyright law does NOT require a person to use the original
software. It is far preferable, for many reasons, to use a
backup. If copy protection is used, often the purchaser is
out the software if it becomes defective. I am in total agreement
with removing software protection and empowering people to
not use the original. All the arguments about software piracy
relate to the strugle between the consumer and the producer.
A producer would ideally like a product that is used once then
you have to buy another one, like cigarettes. The consumer on
the other hand, feels that once they purchase a piece of software,
they are entitled to use it essentially forever. In the battle
between consumers and producers, I have a certain perspective
as a consumer. I think packaging should say if the software
is protected, allowing me to make an informed decision to buy
or not buy. I will not purchase Print Shop for the IBM, because
it is protected such that, without a cracked copy, if I lose
it, I have to purchase another one. On the Atari, I own a
cracked copy, and a purchased copy. I've bought software which
turned out to be totally worse than useless, BBCS and Carina,
for instance. Mike seems to have a one sided view.

You miss the point of everything that went on before, it's not about copy protection, its simply about steeling something just because you want it.

As far a copy protection goes, I agree with you 100% If I buy that piece of software I want to know that it will be good for as long as I need it... I've always believed in having a backup copy (where possible) of every piece of software I've bought...Note: the backup copies stay with me and are never given out but are included with the orig disks when I sell 'em or give 'em away.

Jim, go back and reread my posts...never once do I talk about copyprotection but copyright protection, a big difference (esp. if one never bought the piece of software in question in the first place). Look I don't want to pick on you, I see where you're coming from and I agree with you, you just missed the point of the last several posts.

>for instance. Mike seems to have a one sided view.

Hmmmm, I stand up for what's right and I have a one sided view....interesting. Then so be it, I've got a closed mind on theft. I'll tell you what though, you publish a shareware/commercial and you'll see me fighting just as hard as I do for ICD, Pab Sungenis, and the rest. The're a lot of programs out there I'd love to have but I'll be damned if I'll steel 'em to get 'em...

But then again, thats just me and my one sided view...

Take care

2240. Re: Micromiser

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-03 13:20:28 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <21412s$srr@usenet.INS.CWRU.Edu>
Source record: 106352

I'm not using a 'quoting' reader, but this is about several
posts about MicroMiser. Mike said I rather missed the point.
I did/do read a bit 'scan' like. but the discussion seemed to
be a condemnation of having 'cracked' software, as if it was
piracy to do so. The original discussion started, I think,
about out of print software and the willingness of the person
to get it any way they could. This was referred to as stealing
if I remember.
The intricacies of the copyright law, which is basically a
way to settle fairly the struggle between consumer and producer,
are frequently not absolutely clear until a big lawsuit occurs.
Not even then. Take Apple's suit against MicroSoft. The primary
principle in copyright law is the concept of 'fair use'.
What I think is fair use quite probably others won't. I think
it is fair use to get software ANY WAY YOU CAN. I owned and used
Print Shop many months before I decided it was right to buy it.
Now, I'm sure many people NEVER buy it.
Out of print software follows my same idea. Get it ANY WAY
YOU CAN. Then consider the source. I know I owe Bob Puff, I
haven't yet registered BobTERM or Disk Comm. I just haven't
paid it. I have registered other shareware, tho.
I accused Mike of being one sided because he seemed to be
proposing the view that unless you purchase softare from a
retailer/vendor, it is stealing. Well, stealing and software
don't work. You get it, you use it and then do the right thing.
Some you buy, some you get through friends, some you get over
the modem. Copy protection is right in this area, it isn't a
separate issue.

2241. copying

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-03 15:12:03 UTC
From: G44@delphi.com
Message-ID: <01H03QCOKL3M96WVD4@delphi.com>
Source record: 106353

I see there are some on comp.sys who feel equaly about this issue as there have been users on Delphi.
It is so nice to see that you can equally ignore the fact that I continue to pay for used software and hardware
from the remaining suppliers as a means to obtain the sofware I want.
If my posts mentioning the dreaded word "copying" send someone off on an unethical path because they simple
DON'T WANT TO PAY, then that is their problem.
The way I look at it, if noone has any used MICROMISER stuff (and in all my travels I have NEVER seen it pop up in
a for sale post) and I can't get it from the parent company, it is either:

Continue to be depressed by the fact that I can NOT UTILIZE MY HARDWARE EFFECTIVELY FOR APPLICATIONS PROGRAMS SUCH
AS DATABASES, feuling my desire to LEAVE the platform,

Or I can obtain the program by any means necessary and thus be content that I am FULLY UTILIZING MY HARDWARE with the
BEST, most POWERFUL software.

I started modeming right at the end of MICROMISER availablility at B&C, RIGHT when I decided I wanted it, B&C was
out of them.

You guys can label me as the devil or lump me in with the Game piraters of yore, fine, I don't care.

Knee-jerk responses are expected from a few.

Just READ my damn posts and try to make a distinction here.

I'm trying to be as fair as possible, but I am NOT SO VIRTUOUS AS TO SUFFER UNDULY TO REMAIN PURE.

When it comes to DATABASE programs, only DISKBASE comes anywhere near
TURBOFILE... And I have a multiplexed system off of a 155 meg SCSI so you could say I could use a powerful databse.

The prospect of using FLOPPIES for storage of databases to me is like using a go-kart when you have a dragster.

In the future I will not POST of my intentions such as this, as it may
be construed as condoning all pirating, which I am not, or of suggesting people do likewise, which I am not.

I would gladly pay the large figure MICROMISER wanted for TurboFile.

I will not TOLERATE anyone making up things about my character or my ethics.

They can disagree with my willingness to cross the line as a final option, but beyond that, do NOT say that I
am "shoveling dirt on Atari's grave".

I run a BBS and I helped convince Delphi to get a new 8-bit SIGOP, and have been offering advice
to David Hunt, owner of Carina, to do several useful things to strengthen the Carina net, and to eventually cross-net
it with Forem and possibly PRO!

I have also provided 3 spare R-time 8s to needy sysops leaving me with only one, to help them out--and I didn't gougue
them either.

So agree to disagree but don't start pontificating.

I agree with most of what Mike has had to say, except one thing: its not always just black and white, right or wrong. Nothing ever is, even if we'd like it to be. Some companies are no longer with us, or just don't care but haven't explicitly declared their stuff PD in the US. Realistically, at some point *nobody* will be selling software for the 8bits. Would you still make the same arguement then?

I just think there's a lot more grey area to it than you'd like to admit.

[this thread keeps coming back, and there's always 3 sides to it.]

I will be very interested in seeing your video upgrade(s) for the 800XL, Ben -- are you able to get rights to your one from Current Notes for re-publishment (?) in AC? I never realized how $#!++y the video on the XL was until I tried to use a couple of programs recently that fill the screen with characters and set the foreground/background colors "just so" --- then it's "aliasing city, USA" and ya can barely read a thing. I _think_ maybe I'm referring to your "Squeezed Queen" upgrade, but am not sure that's the right name. I seem to remember you recently saying here that the ONLY source for that material was back issues of AC; is that still the case? I need a cheap fix... for the computer, that is!

A New Guy named Michael Winters writes:

>Hello Atarians of the world:

Hello and welcome!

>... In 1982, I had an Atari 800 with one disk drive.

Me too. :-)

>In 1988, a two year old spilled a cup of fruit punch on my 800 [...]
>smoke came out of it one day, due to a short.

My 800 gradually developed bizarre graphics problems and nobody could
fix it (heck, they couldn't even reproduce the problems; they had air
conditioning in the shop and the problems only happened when the ma-
chine got hot; I still have it in the close if anyone can suggest a fix!).

>A year ago, I got back into the Atari world and picked up an 800 for $35.00

I didn't wait but ran right out and bought a friend's used 800XL for
about that same price... what took you so long? :-)

>Sunday, I was in Laurel Md. at a
>thrift shop and found TWO 1050 DISK DRIVES and a 800XL Atari computer for
>$10.00 total.

Jeez-o! Such a deal! So tell this poor ignorant bargain-lover: just
what IS a "thrift shop" and how do -I- find one? :-)

>Now, after getting this
>junk out of my system, I have a few questions: Does anyone know of a
>good C program for ATARI (public domain, shareware, commercial)? I
>tried APX C and it took forever to compile....

There are several C packages for the Atari 8-bit; I don't know sources,
but undoubtedly someone else will pop up and fill in here:

Ace C - commercial? PD?
CC8 - PD, uses Ace C's run-time library
CC65 - PD, produces relocatable code (!), has its own libraries
etc, comes with/as source code, can be built as a
cross-compiler on other platforms
C/65 - from OSS, the folks responsible for Mac/65 et al
Probably one or two others; personally I'd never heard of APX C.

>Also, is there (don't
>laugh :-)) a public domain "tiny-UNIX" avilable for the Atari?

Not that I know of; the multi-tasking capabilities of Unix would be pretty difficult to duplicate in the limited memory of an Atari 8-bit system, although you might JUST do it for several VERY SMALL programs. Someone has produced a "task switching" package that works on the 800XL, but it's not true multi-tasking in the sense of "two programs continuously running at the same time," as I understand it, but rather "hit a hotkey to flip from one application to the other, the non-current one getting 'frozen.'"

>Also, speaking of my one disk drive that groans, do those things need any
>oiling? Any good recommended maintainance books on Atari Disk Drives?

Dunno. Dunno. Would LIKE to know. Gang?

>Two more questions - has anyone ever networked 2 or more Ataris together?

Undoubtedly. There's a fellow who posts here periodically about his-and-his-colleagues' ongoing development of something called AGDA, which I think stands for Atari Game Developers' (Something), which as I understand it networks two Ataris together via their SIO ports (the daisy-chain where you plug the disk drives in). Then there's Bob Puff's "multiplexer," which lets multiple Ataris share multiple disk drives; I saw it operated from one room to another...

>Finally, besides the

Your still of the line just a bit...at no point do we (Glenn, Jim, or myself) talk about the "Fair Use" side of copyright law. What I talk about is the breaking of copyright law by coping a "work" and giving it to others with out the permission of the owner (where everwver and who ever they may be).

Is I said before and I'll say it again, you and I hold the same point of view on fair use of software. Where we do not see eye to eye is the idea of getting something anyway you can. As much as it bugs the hell out of me that some Co's (like Atari) will not release their rights to the public, I will not steal their ware's nor will I sit back and alow someone else to brag about it as if its the right thing to do.

Take care

Mike

Source record: 106158

Pontificate? Me? I may rattle on, boar people and misspell words but pontificate? At least I don't take that which isn't mine, what about you...

So you've found a few kids who still think stealing something is just "Too Kewl". There a lot o people in this world that think laws just get in the way... that does not make 'em right.

Glenn, you say you're into films; do you make your own? And if you do and you put 'em out on tape, how will you feel about someone coping them just because there are not enough of them out there? After all they only want the best, right? So they should do whatever it takes to get it, right? Same goes for the T.V. stations, right.... You just don't get it, do you.

Did I ever say anything aginst your support of the existing supplies...NO. So don't get off subject...You give things away, great, so do I. I've put better equipt into the schools I support than I have myself (I use an MIO, I give away the BB's I get). You want to use the best software, well so do I. But unlike you I will not steal it to get it...I contact the owners and guess what... Some like Datasoft even have copies left in storage that they gave me. In short, I know there is good good software out there that is nolonger supported. I too want to see it released to the public. But I will not go on line on two national networks and yell to the world that I plan to steal their software and I don't give a rats ass what they think about it. The folks that hold the DataSoft rights saw that post as did Tom Harker at ICD (the man you wanted to steal from). Thanks man I really needed that kind of help...

Look you just don't get it, and never will. You think doing the right thing is a knee-jerk response...and the way to end suffering is to just take what you want anyway you can. (an interesting outlook on life). I do read your post, for a time I was one of your supportes (in e-mail) aginst folks putting you down for the information you were putting out about other products but I can't support you in this, and I don't think the BCC would either.

Glenn we don't have to agree, but we do need to understand one thing, anything we do here can influence others. Lets do the right thing and support the remaining Atari community, contact these folks that hold software rights and get 'em released either to PD or to someone like Ben P. or Bob P. (CSS). this will help the community far more and far longer than anything else. So, I agree to disagree but when you start talking about stealing i.e. "Shoveling dirt on Atari's grave", then I'll likely be here doing my best to shut ya down.

Take care

Mike

tg> I agree with most of what Mike has had to say, except one
tg> thing: its not always just black and white, right or wrong.
tg> Nothing ever is, even if we'd like it to be. Some companies
tg> are no longer with us, or just don't care but haven't explicitly

For the most part it's a lot more clear than people would like to think. Yes I agree that there is a fuzzy issue about Atari releasing its software rights to the Public in one place and not another (the fuzzy part comes in when you concider the world wide networks like this one and FidoNet). There are a lot of people that are working to keep just what you talk about from happening... but you never know who may be reading the net's... and when people like Glenn go on two national networks and post several time that not only are they going copy Copyrighted software and give it out but don't care what anybody says or does, what kind of immage does that leave of us as a group. Don't get cought up in this "Do what ever it takes" idea, but help out the community at large, write letters, make phone calls, let the folks that hold Atari software rights know we're still out here and that if they support us we'll support them. .Hell, look at Atari Classics, it can and does work.

I have the following Atari 8-bit items for sale. I would like to sell the whole lot for $100 plus half the shipping. Realizing that this might not happen feel free to give me offers of cash or trade. In trades I am looking for cartridges for the following systems: Atari 2600, 5200,7800, MicroVision and Vectrex. I am also looking for issues of Atari Age. Thanks for listening. Also included in the deal but not listed is about 2000 (I am NOT kidding!) floppies full of software, some are originals, some are shareware, some are APX, some are PD. You could not go wrong. Just in the downloading time alone you could spend $100!!

2252. ScotchDOS

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-04 03:52:54 UTC
From: G44@delphi.com
Message-ID: <01H04GULGTSY936K4D@delphi.com>
Source record: 106164

Bill, I am happy that you are again making some progress with ScotchDOS.
I think using a ramdisk is fine, by the way.
If your code gets really big you could dow what TOM HUNT did with SRP and store
almost all the commands as externals to keep MEMLO down nice and safe so it will run with
the MOSt programs
even with tons o handlers.

However, I think the method you described for BOOTING UP was pretty cludgy.

If that is how you have it working now, okay, if it works.

But I think ideally a NEW RAMDISK HANDLER should be written altogether.
MYDOS indeed needs a new ramdisk formatter that can handle the huge >1 meg NEWELL upgrades
anyhow.
Plus, MYDOS also needs an "under the OS" ramdisk which was written for 2.5!

An under the OS handler would probably allow the CORE commands of SCOTCHDOS to be used on a
64K system,
and you could keep other stuff on floppy (for the floppy user).

Like rarely used commands and stuff...

Not DIR and COPY...

You would have to automate things so that DUP.SYS did some things automatically on bootup
or load.

On bootup:

Check SETUP.BAT (or CONFIG.SYS)

This BAT, or merely STARTUP.BAT, would send the command to format the ramdisk with
parameters for ramdisk config...

It would autoload utilities to D9:, whether it be under the OS or XE banks.

Then all externals would be looked-for on D9: (the path), if not found, then check D1,
etc....

Then drop to the CLI.

Upon going to and from MYDOS with a 64K system, the new DUP.SYS would have to
check D9: (which would now be corrupted or gone entirely) and remake the ramdisk.

So it would have a check, if it goes to DUP and the externals are intact, then it doesn't
reload or reformat
anything. But if it sees it is all screwed up, then it would remake it.

You could probably make this even smoother by it checking the LOAD POINT of a file, and if it is going to load under
the OS, have it set a flag or wipe the ramdisk or something to clean it out.

Anyway, an Under the OS ramdisk isn't essential, but it would be useful.

One side effect would probably be full CGS compatibility.

By cutting the fat out of MYDOS and lowering MEMLO to the 2.5 or lower level, and having the under the OS ramdisk,
I think loading BOBTERM with the CGS handler would actually work, with like 10 fonts loaded.

I can see some parallel SRP/ScotchDOS development going on, and if and when you produce a beta
for me to test I would like to pass it along to TOM to take a look at, if he is impressed I think he will be MORE
likely to get going on fixing the problems with a CGS/BOBTERM/MYDOS system.

If you have trouble rewriting the RAMDISK handler/formatter of MYDOS there are several people to consult.

WES NEWELL might know some info (on FIDONET)
BOB PUFF of course..
Plus the guy who wrote 4.53/4 if he is still around.
Plus Tom Hunt, though he is not a MYDOS afficionado.

Plus you could see what this forum gets you, or post in my Atari 8-bit DEVELOPERS' co-operative SIG at:

617-444-4310

Which is currently networked with 4 boards including the Carina hub.

I am anxious to see some source code from you soon, whenever you are ready to gimme some <panting>

As I would like to repost the ACTION! source on my board in the developers' sig so that many more minds can add their input, which is always going to be good.

But of course it is up to you...

2253. Micromiser

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-04 04:13:45 UTC
From: G44@delphi.com
Message-ID: <01H04HGB6UVC936K4D@delphi.com>
Source record: 106165

Mike is attacking me as if he has one of the flagrant game piraters in his sights, which he attributes
to the lack of software support, and I am acting as his punching bag so that he can work out his frustrations.
I do not appreciate this, and if anyone has to act more maturely it is he, since he is the one with the sharp
tone and the expletives.

I am just waiting for him to go all caps and start posting:

AAAAAAAAAAAAAAAAAAAAAAAAA!!!

I obviously set him off on an insane frenzy, he isn't reading my posts, and has no understanding of my motivation,
my contributions to the userbase as a whole, or my ethical stance, which I would argue is much better than most!!

How many people put up $90+ a month for a BBS to serve the 8-bits?

How many 8-bitters spend countless hours online picking up useful info to spread to those who don't have the time
to do likewise?

FYI-- I don't even OWN a SuperArchiver 1050, and have NEVER deprotected a piece of software.

I have, however, and I am not the only one, let's not build fantasies here, picked up PIRATES in my travels.
I'm not one to look a gift horse in the mouth, if I see something sitting there for me to grab it, I am not just
going to ignore it... But I do feel guilty having them--I DO have a conscience ya know.

I have also paid quite a few shareware fees for the stuff I use a lot.

So I wish he would get off my case.

I'll be the first one to buy MICROMISER stuff if they make more, I have no reservations about BUYING software, money
is not the motivation, it is AVAILABILITY.

If people like MIKE want to live out the rest of their 8-bitting by ONLY buying software that they come across, and
thus lock themselves out of some rare stuff, that is THEIR problem, but:

When the time comes... and it WILL, mark my words...

People will either have to put a gun to another 8-bitters' head to give them their only copy of "x" or they will have

to simply get it cracked for their own personal use.

Now, I for one do not have the resources to go around trying to buy the rights to every single piece of software
in the "grey area" of rarity, desirability, and company bankruptcy or non-support.

Nor do, I would argue, most other users.

I have more immediately productive things to spend my money on than this.

I can CONTRIBUTE to those efforts, but I can't do much leg-work on this stuff, it is much too daunting a task.

So...

When _I_ make the judgement that the MICROMISER issue is closed, and they do not decide to sell the rights, or
do not agree to make another small run, then I can only assume that they are giving the 8-bit userbase a collective
F**k Y** and I don't especially care for respecting the rights of companies which had more than a few chances
to sell more stuff and just gave up.

How much does it cost to copy a disk???

How many 8-bitters are left???

It would probably cost MICROMISER less than $500 to make a large enough run of their software to personally deliver
it to every POWER USER 8-bitter remaining in existence.

I wish those involved in MICROMISER negotiations the best of luck.

What they should get out of my posts, if they have a brain, is that over all I WANT THE STUFF, not that I am
"ready to start a pirating operation".

If anything they should be heartened by my posts that I would be so interested.

And they would know that I would not resort to nefarious means unless they did NOT follow through and sell the rights.

If they think they can make more by tracking me down and litigating me, so be it...

By the time I make my decision, probably 6-12 months hence, I will have moved,
I will have a different handle, and I really don't see why a company would spend a ton of legal fees on prosecuting
a LOWLY 8-bitter when they keep on whining that we are too CHEEP to buy their software.

I've seen a LOT of pirates on certain boards that have been up for years and as far as the 8-bit goes,
they may CARE in principle, but pragmatically speaking they DON'T DO ANYTHING.

So I am not afraid of making my position known.

I think on the spectrum I am much more respecting of rights than the average 8-bitter.

And it doesn't do any good MASKING the fact that pirates exist as if it is some taboo word.

I think in nearly 15 years that 8-bit suppliers are FULL AWARE of the problem, and aren't these niave creatures
that just read my post, were flabbergasted,and decided never to support the 8-bit again.

Now THAT is fantasy.

-Glenn Saunders

Glenn, you want to talk about fantasy, then look at your self. On one hand you talk about all the good you do (your far from the only one, a good many of us here do much the same thing), you talk about your experence as an 8bitter, and what you do in real life. Thats great, I've never yet knocked you for that, never used you as a "punching bag" for all the good you do do. Lets talk fantasy for a bit, you say you want to see producers put out small runs of their titles, oh say 500 to 1000 copyies and lets also say they put the doc's on disk (to save money) use no printed boxes, nothing.. You say you'd like to see this but at the same time you also offer them an ultimatun, put it out or else... Glenn, your not dumb (you posting above proves that) so you and I both know more or less how it is software producers feel about the Atari, so how do you think it really makes 'em feel when they see that kind of post... You know, you and I are a lot closer on many points than you might like to believe, we just go about it in different ways. That little deal about the small press run, the one with no printing and no box is an Idea that I am pushing even as we speak....and it maybe me putting up the $2500 to $3000 it will cost...and if everything sells I'll just break even.... I love fantasy, just wish my SO loved Atari fantasy as well.

Time to step out into the sunshine...type in all caps??? didn't that kind of thing die out in the Atari newbe days? Isn't that how we all can tell a new user from one who's been around for a while...kinda like that new guy that just hit the FidoNet. No Glenn you don't bug me that much, in fact it seems to be the other way round...Seems you and maybe a few others don't like that I'm willing to make a stand on an unpopular issue, sorry. Just as I'm sure you do, I know I'm right. However I'm also trying to do something to keep just what you talk about from happening.

Just outa S&G (don't want to use any more hard words) how many 8bit users do you think there are (willing to spend money) left in, oh say, just the U.S. If it toped out at a 1000 it would surprise me (Note: I did say willing to spend money i.e. invest in improving their system with software and hardware). Look at A.C. as an example...The last fully 8bit mag. in the U.S. and it can't even get 500 subs. The sad fact is a good many of the remaining users would rather copy something than buy it...Its just a fact of where we are today. So why tell you this. Because, when people like you who've been around for a while start advocating, take what you want, any way you can, It has a great effect on people. People like you and I, Ben, Jeff McW, Bob P, have to stand together. Yeah I pick on you, why, because I know you're better than that.. read your own posts...we only disagree on one point...

Yeah, guess I do live in a fantasy. Then again I'm in good company, Ben P., Jeff McW, Bob P. Best, B&C, ATV, DataQue (Chuck S.), Rick Reaser, Wes Newell, and too many others are there with me. Glenn, I know what I'm talking about, I've talked to some folk that are really down on us "Software Stealing" Atari

people...The feelings have not gone away. No, no one will chase you down and take you to court (you and I both know that). But the feelings are still there. So, Yeah I pick on you. I can almost hear you asking if I really believe that I can talk any users out of dubing wares...na not really, but don't you think someone should try... You think I'm living a bit of a fantasy thinking I have a chance to change things, well in a way I guess your right. but your own past postings to the net say you beleive in the same fantasy, that being, we can make a difference; motivate with and by our actions.

Hang in there Glenn, you'll get it yet (ghod that's getting to be such a catch phrase)

Take care

Mike

I noticed you were talking about hooking a hard drive up to the Atari. If you or anyone else has info on how to hook up a hard disk to an 800xl please let me know.

Back in the old days of the 810, some of my friends would grease up the internal rails with all manner of goo. This may not be such a good idea as the grease may splatter on the head(s) or the disk itself but at that time the noise became very annoying to some (I know some find it endearing so no flames please) Another alternative I've heard of is to use those carbon graphite sprays you find in the automotive stores but there again you might run in to the same problems.

Source record: 106169

You can pretty well forget about pleading with MicroMiser to make "one final production run" of their products or anything of that nature. The guy has moved on to more lucrative platforms & doesn't care about the 8bits any more.

In any event, pirating a MicroMiser disk won't help you either. Without their manual it take you 83 years to figure out how to use their stuff, their software is extremely sophisticated & highly disk-access-intensive. Reminds me of Mac software. The manual for TurboBase is around 200 pages I think. TurboWord & TurboFile are around 100 pages or so. Hacker's nightmare.

I sympathize with people on both sides of this issue. I think it's fair to say there's not a single one of us who hasn't as some time reverted to illicit copying when we couldn't find what we wanted in the open market (including my own self, I'm sorry to say). As our market has contracted, the conflicting elements of necessity, morality, and legality have all been brought into sharp conflict.

Anyone who purchases 8bit product rights for cash these days will almost certainly suffer a loss. My own interest in MicroMiser stems not from a desire to make money but from a desire to shore up the foundations of Atari Classics. The entire AC subscriber list is at risk as long as I continue to use the present version of TurboFile, which we have found contains a truly hideous bug. MicroMiser no longer supports the product & won't fix it, which places me in an untenable position. The only way out is to purchase the rights, fix the bug, & maybe hope to cut my losses by offering the product on the market again. Have I been screwed? Absolutely. Right up the ole' bung-hole. But with the remnant of the entire North American market hingeing on my activities, I got damn little room for maneuver.

MicroMiser's sales of its 8bit products were pathetic even at the height of their market in the late '80s. I cherish no illusions of becoming rich, or even turning a profit on my investment. And, since I'm not engaged in a business, I can't even write off the loss on my taxes. I will eat the loss.

I frankly doubt if anyone can make money on ICD's products. At best, they will break even. The unwillingness (or inability) of 8-bitters generally to spend money, combined with the tiny market our much-ravaged community comprises, make for grim realities in the financial analysis. I still find it incomprehensible that Computer Software Services can exist.

If we are ever to rescue the ICD products or any other commercial products for restoration to our market, some motive other than Profit alone will have to be found. The realities of the market are harsh & cannot be ignored.

Atari 2600 system and items for sale:

Atari 2600 in excellent condition, with manual (I even still have the original box for the machine somewhere here).

Black hard plastic protective hood that goes on top of the Atari 2600, with a place to put the cartridges and manuals on the top of it; it also allows joysticks and power supply cable to be connected, so the whole system can be conveniently operated with it

Atari joysticks

Official Atari Log Book (like new)

A series of Atari catalogs from different dates.

One case for holding Atari cartridges, black plastic, with push-levers that eject out desired cartridge

Atari dust cover with Atari logo on it

The above items are all tested and are in perfect working condition.

(I also have -

One pair of Atari radio remote-control joysticks
One pair of Atari paddles
which were purchased used and never tested. I have been told that they are in working condition when I bought them, but I never tested them myself. This is only for the remote joysticks and paddles. All other items are tested by me and working flawlessly).

This is for Aaron Barnes:

GET THE HELL OUT OF THIS NEWSGROUP, YOU STINKING CRIMINAL !!!!

Yes, that's a flame. I am HORRIFIED to see a post like this in our newsgroup!

Why am I reacting so strongly to this? Simple: I once got suckered into exactly such a scheme as Aaron describes. Before it was over, the FBI was involved, & I got the scare of my life.

MAKE.MONEY.FAST is nothing more than a pyramid scheme. It is INHERENTLY fraudulent & ILLEGAL, I'm talking FEDERAL penalties here!!!

The authors of these schemes all seem to be cast from the same rotten mold. The wording of Mr. Barne's post is very much like what I have seen before, they all follow the same guidelines: they pretend to offer a "service", they quote some leagalistic hogwash to make you feel like it's legit, & they follow it up with several glowing testimonials from individuals who made millions by just sitting back & watching the cash roll in.

Aaron is 27 different kinds of STUPID to post something like this.
And anyone who participates in the scheme is even more stupid.

PEOPLE, DON'T DO IT !!!!!!!!!
Unless you want to sample the cuisine at Leavenworth.

With utter horror, revulsion, and disgust...

There was a game for the Atari 8bit that I loved to play
many years ago. You had a board divided into a grid, and
each gridsquare had a different section of train track. You
had to keep re-arranging these sections to keep the train
from crashing.

Anyone recognize this one/know of a source?

Thanks,
Brian

Source record: 106175

Chris,

The "Squeezed Queen" was an upgrade to the 800XL Type I power supply which increased its power output by 45%. I reverse-engineered the original design indicated by the unstuffed locations on the circuit board. That upgrade was published in the Nov. & Dec. 1991 issues of Current Notes (See the FAQ list CN's address, I don't have it handy).

Super video 2.0 was published in the Sept & Oct 1991 issues of CN. I was really on a hardware-hacking "roll" when all the calamities struck which drove me from my position at CN. I think CN still offers these back issues for sale.

I'm still hoping to present Super video 2.1, plus a bunch of other video-related hardware & software stuff, in a future issue of AC later this year- Oct? Dec? Dunno just yet.

Super Video 2.1 will incorporate SV 2.0 as its base, so 2.0 will be presented in the article I'm planning for AC.

Joe Waters has released to me all the original material I generated during my 2-year tenure at CN. Including even my "Alchemist" logo. :) :) :)

So there's lotsa interesting developments in the offing. What I need is TIME to re-work this material while at the same time continuing to direct the opereations of AC. It's getting to be a pretty tall order....

You can order the back issues of CN now, or await future developments in AC. you have nothing to lose by doing SV 2.0 now, since you'll have to do it any-way to reap the benefits of 2.1. 2.1 is really only a refinement of 2.0, & also an extension of the Super video concept to the 600XL & 1200XL.

Hope this helps! :)

- BEN POEHLAND
The 8-Bit Alchemist

PS- I'm away from the Net till July 12. Ostensibly on vacation, but while the rest of the USA is enjoying backyard barbeques, watermelon & traditonal 4th of july fireworks, I'll be hacking out the August issue of AC & hope-fully putting the finishing touches on Super video 2.1.

Hay Glenn, I think it's time to move on to bigger and better things. Got a piece of e-mail this morning...

From winters@access.digex.net Sun Jul 4 10:31:39 1993
From: Michael Winters <winters@access.digex.net>

Hmmmmmm.... Interesting arguments on both sides - you both gave me some good ideas. I have an idea - if only 500 people are willing to fork out 20-25 bucks to subscribe to A.C. (which is partly due to apathy - just spending a few minutes sending a check in, or maybe people don't want to spend the money etc...) I saw that magazine and it certainly looks excellent - would like to subscribe to it (when I GET around to it :-)) I have an idea which I haven't seen happen too much - Why not put an online magazine on this news group, devoted ONLY to Atari 8 bit stuff. This would provide more in depth converage of things, rather than the obviously, piecemeal converage people get of topics that interest them. What would be neat about this is that the INTERNET Atari 8 bit "magazine" would be written by the Atari programmer/user etc... community and could possibly be more up to date than any "printed" magazine you see in a store. what do you think? any one volunteer to be an editor (I would, but I think there are people out there with tons more Atari experience than me :-))
--- MIke Winters

Something interesting to think about, what with Znet8bit dead and all. I know you've been working to put together a programers co-op...Do you think it would be possible to include the results of that effort in or make it into an online Mag? Something to think about...

Take care (sorry I jump so hard there at the begining)

Hi. I am currently in the possession of an Atari 130XE given to me by a friend who wishes for me to "get it working." I suspect the reason he couldn't use it is because the box one connects to the TV is broken so I will have to get a new one. The other problem is that it came with no software or cartridges...so even if it in't broken, it will be difficult to test. I know of the sites on internet which contain atari software but, as of now have no way(i.e. do not know how) to transfer files from ibm to disks readable by an Atari. I know there is something called util.exe but I really don't know what it does save that I've heard it used with ibm and atari in the same sentence. I am wondering if this is the equivalent of teledisk and will allow me to make atari readable disks from my ibm or if there are teledisked files out there which I can use to make such disks. If anyone can help me with my dilemma, I will be very thankful :).

Mike Winters's idea is nothing new. In January of 1992, when I proposed
the mail in campaign which ultimately led to Atari Classics magazine, there
were several people on the net who suggested an online magazine would be
a better alternative. I was against such an idea then, and I'm still
against it. Atari Classics currently supports 497 readers. How many
of these readers have Internet/GEnie/Delphi/Compuserver accounts.
Fifty? One hundred? Can't much more than that. ACTIVE posts on this

newsgroup come from a handful of people, about 20 I'd say.

The sad fact is, that despite the low cost of even 1200/2400 baud, and new 9600/14.4kbaud modems, relatively few 8 bitters have modem capability. It's all part of the tight-fisted attitude of today's 8 bitters, who would rather use a 64K machine with a stock 1050 drive than spend a few bucks to drastically improve their computing environment. An online magazine would never reach the readers a print magazine does.

Additionally, any 8 bit online magazine will still be inherantly text based. This excludes the possibility of including commercial advertisements, schematic diagrams, photos of hardware modifications, or other highly visual aspects of a print magazine that make it worth having.

Thorough coverage? When SuperVideo 2.1 comes out, you can bet the farm that Ben will ensure that it is COMPLETELY thorough. How about my current series on XE type expansion upgrades? 3 parts have gone to print already, and I expect I'll have 3 more installments before I completely cover all the programs out there, deal with Antic banking, and perhaps talk about what hardware memory upgrades are left on the market.

The only thing that makes an online magazine appealing is that it would be FREE. Have I been missing something? I thought we're trying to shake off this "Cheapskate" reputation that the 8 bit market has.

I must conclude that an online magazine is a bad idea. A print magazine like Atari Classics beats it hands down. I am adamantly opposed to any online magazine idea presented. If there are still people out there with the time and capability to edit an online magazine, I must truly wonder why they don't instead offer their services to Atari Classics, where Ben Poehland edits all incoming manuscripts, handles all subscriptions, runs the magazine and disk databases, and oversees everyone else.

2267. Programmers' CO-OP

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-05 05:07:19 UTC
From: G44@delphi.com
Message-ID: <01H05Y121RGY936RCK@delphi.com>
Source record: 106179

Trying to get the co-op to take off has been difficult, but I am making some progress.
Step one was to get it networked on enough boards so that some programmers could dial in locally and post.
I am working towards that goal.
Presently there are 4 boards in the network, and possibly 2 more if I can get them to do it.

I also reached the programmer of the UNIX CLI, but he only called a couple times and I'd probably have
to contact him personally again in order to get him to call again (he is one area code away).

I have tried to generate some posts by talking about one of my online projects, but that will only go so far.

As soon as I can get the 2 other boards to join in, and then hopefully others will join by netting with the hub,
then perhaps I can snag a notable shareware programmer.

The way it will survive is to have a useful project in the works that is worked on communally.

It will probably be a couple months at the very least before it matures.

But, I should say, it IS there, and any programmer who wants to contribute is free to.

Symptom of the Universe BBS
617-444-4310

He will most likely get some replies.

For instance:

"Hi, I am working on a FAX program to finally give the 8-bitter fax capability but I need some
specs on FAX data transmission."

now, that would generate some replies...

or:

"Hi, I am working on Zmodem, does anyone know how to add modules to BOBTERM?"

8-bitters are cheapies, and the only way this thing is gonna fly is if every
carina board that is networking, is carrying the sig.

But, I'm doing what I can.

It's too bad TOM HUNT or some other programmer isn't sysoping a Carina board.
Then he could use the SIG as a beta-tester sig and a press-release sig for shareware like TOM does.

Still waiting for Bill and his ScotchDOS, I will be glad to act for him in proxy in posting the source code
and relaying replies and advice back to him.

Hay Jeff, hope you enjoyed your forth.

While I agree with you about the state of many in the Atari community, speaking for myself, one who subs to AC, AIM, CN, Connect, and a number of other IBM and Mac mags, I've always like the idea of an online mag (Betazine, Zmag). Kinda like a Fanzine if you will and didn't Analog start out as just a computer shop newsletter? (I may have that wrong). I would never stop someone from doin and contributing to the remaining ommunity. I'll give you another reason I like 'em...I can get 'em into school and get 'em to everyone (the kids arn't going to sub to AC and the schools just will not spend the money). For myself, I like the idea of a hardcore programers Mag, that's why I brought it up to Glenn...He's doing a lot of work putting together a programers co-op and I can see this as a way of spreading what is happening through out the bbs world. (Ghod knows I'm on enough nets...) Might even get a few sysops to join in his building network...

Anyway, its been a longone..............

Ya'all take care

It is possible that Atari had a larger presence in Europe, but they still
didn't exactly go all out on the advertising either. Since 1989 I have only
seen about 2 seconds worth of Atari 8-bit advertising on TV, and that was a
screen shot which lasted for about 1/2 second tagged onto the end of an
advert for the XEGS. Blink and you miss it. At Christmas time you couldn't
switch the TV on without seeing S*ga, Nint**do, C64, etc advert
(unless you watched the BBC - no adverts :-)), but Atari adverts were
a rarity!

Ben the "Alchemist" is also Ben the "Purist". Ben, for $200 you can have an IBM compatilble, mono monitor and 20 meg hard drive. Then use PC File for your data base. The thing is to get Mr. McWilliams to hack your data base data so that it is compatible with PC File or some other "cheap" data base for the IBM. Really Ben, if you use an IBM, you might lose some of your charm and purity, but you will keep some of your hair.

Here, in Chile, a network for the 8bit was on the market.
I don't know the procedence of this hardware.

It consists of a small 2600-cartridge-like that has three connections:
a SIO cable to connect to the computer, a 9-pin female connector on
the box, and a 9-pin male connector cable to link to the next box of the
network, like:

```
client client client server ___ /__/
[ ]-------->[ ]---...-->[ ]--------->[*]-------[===]----[___]-----...
_|_ _|_ _|_ _|_ disk printer to
/_=_\ /_=_\ /_=_\ /_=_\ drive any
/____\\ /____\\ /____\\ /____\\ sio
8bit 8bit 8bit 8bit device
```

The box marked with a "*" also has an extra SIO connection to attach to
any Atari 8bit compatible device, and acts as a server of the resources,
so only one computer in the network can use the devices at the time.
The 8bit attached to the server box has the same privileges than any
of the client 8bits, I think :-)

This also requires a modified DOS to don't time-out at the request of
a device. I don't remember how much secure is this network, in terms
of data integrity of the diskettes or noise in the communications or
data in printer's buffer.

I know this implementation does not allow communication between computers.
It acts only as a peripheral devices server, just like the "Black Box"
(that's the name?).

Bye... ++V

PS: I'm still receiving new names, e-mail addresses and info of c.s.a.8
readers. Only few sent their personal info, like authories of
commercial/pd programs, publishing, and non-atari famous.

[Mounting soapbox...]

This kind of thing just sickens me, particularly now when many people are out of work and desperate enough to succumb to a scheme like this. There's a scam artist in the Toronto area who has a similar deal going; he plasters the city with flyers in everyone's mailbox promising them they can make up to $50/hr in their own home by stuffing envelopes in their spare time. All they have to do is call a special 976 number for more information. This sort of "promotion" appeals to people who can least afford to be sucked in - recent immigrants, the unemployed, and those on welfare. The phone call costs people $10.00 which enables them to listen to a taped message which is utterly worthless. They get absolutely nothing for their money PLUS they're out the $10. The people who promote these things are, in my opinion, nothing but slime.

Aaron may have posted this out of naivety; I sure hope so. If ever the old adage "You don't get somethin' for nothin'" applied, it's here. Regardless, this posting violates the Cleveland Freenet's guidelines on electronic chain letters and I have forwarded a copy to the Freenet administration for their review.

People, please, this is the comp.sys.atari.8bit newsgroup, not the make.money.fast newsgroup. I mean, geez, if ever there were two things which were diametrically opposed, it's the 8-bit Atari and making money. Just ask Atari. <grin>

[Dismounting soapbox...]

We now return you to your regularly scheduled programming [pun intended].

>Ben, if you use an IBM, you might lose some of your charm and
>purity, but you will keep some of your hair.
>
James,

Oh sure. Easy isn't it? First, we have to deal with somehow translating
turbofile records into PC File Records. God knows if it can even be done
without manually retyping in the data. You're gambling on that
aspect alone. Then Ben has to spend time learning MSDOS and the PC
architecture. After Ben has figured out MS-DOS, he has to deal with
learning PC File. How long will that take? Who's to say this PC File
can actually do the things needed to keep the AC database alive?
How much time is this all gonna take, for a guy who works 50 hours a week,
and puts in another 30 hours a week as an administrator for Atari Classics.
This included Editing the manuscripts, proofing the camera ready
copy, dealing with staff members and freelance article authors, dealing with
Disk distribution, etc. The point is, a whole lot more effort would be
spent going from 8bit->PC than just fixing the few bugs existing in
Turbofile. Further, an SIO driver 1025 printer is responsible for
printing labels. Not because it's Ben's only printer, he also has a
Epson 9 pin and an Epson 24 pin printe The 1025 is built like a tank, and
will most likely continue printing on into the 21st century. You can't run
a 1025 off of a PC.

Further, all manuscripts and edited on an Atari 8 bit computer.
Should Ben also invest in a PC word processor and spend time learning how
to use that? I'm sure Word Perfect for DOS is SOOO easy to learn,
F1 is help isn't it? Or is it exit to DOS? Real user friendly, easy for
Ben to learn. And hey, since we don't want to use the 8 bit anymore,
we need a telecommunications program too, and umpteen million other things
that already exist and work well on the 8 bit.

The point is, the 8 bit works just fine. Switching to a PC will not make
life easier. Most applications for the PC are more complex, and more of a
headache than similar 8 bit programs. PC programs offer more features,
but that's part of the problem. Unless you switch to Windows
(i.e. MORE NIGHTMARES) Ben would have to spend weeks of time doing nothing

but relearning how to use applications.

Ben's not a purist, he's a realist. He has a 286 sitting in the closet next to his 1040STE. He knows what works for him, and what is a waste of his time to deal with. Pretty much all 8 bitters are these days.

This sounds a lot like the Supra networking box that I saw in
either Analog or Antic magazine a few years back. It went over like a
lead balloon. It was similar to the one described above: there was a
main SIO connector where all shared peripherals plugged into, and then
additional SIO connectors where the 8 bits plugged into. Like the one
above, the Supra device had problems. If computer A used the point command

to point to a location in a file, there was nothing to prevent computer
B from then writing data to that location in the open file, thus
clobbering data. I'm not sure how the Multiplexor by C.S.S. ensures
that different networked 8 bits don't clobber each other. Maybe
Glenn over there from Delphi can tell us mre about this.

You have to agree with Jeff here, Atari Classic is about, by, and for, Atari 8bit users...why shouldn't it be run from an 8bit? Sure we can try and push Ben into using a clone but then why even bother having an 8bit mag in the first place...I mean lets get real here, I can't type any faster on my IBM 486 or MacPlus than I can on my 8bit (with TransKey). Data sorted on my IBM comes out looking just like data sorted on my 8bit...Oh faster you say, why? One, I'm in no rush, and two, using my hard drive and ram disks it almost takes no time to sort through a fair number of records (I use both DiskBase and SynFile with an MIO). Just because there's a bug in one program doesn't mean its time to get rid of the system (I know thats not what you said but it seemed to be where you were driving). If I followed that kind of logic, I'd have dumped my clone the min Windows 2 came out, then again when the first issue of PCfile (too many bugs) and lastly when the new Pkzip 2 came out and liked to killed my backup collection... Working through software bugs is just a thing we work through, not something we abandon a platform over.

I know you were just trying to help, but that kind of help kind of goes aginst what we're trying to do here and that is to show that the 8bit system still has its place here in the "Real World" (tm).

Look ma, my 8bit, she ain't a toy no more!

Microsoft Introduces Classic Arcade Games for Windows

REDMOND, Wash. - July 6, 1993 - Microsoft Corporation
today introduced Microsoft* Arcade, the newest title from the
entertainment product unit. Microsoft Arcade is an accurate and
faithful replication of five of the most
popular arcade games from Atari - Asteroids*, Centipede*, Battle Zone
, Missile Command and Tempest* - for use with the Microsoft
Windows* operating system. These high-quality games were reproduced
to give users the same look and effects on the Windows platform that they
recall from the original arcade versions.

2280. Emulator to run 8bit programs on PC?

Something you might try if KERMIT-65 is giving you problems is to
attempt to make the transfer using ACTION! KERMIT. ACTION! KERMIT has no
user terminal interface to speak of, but it may not give you the same
problems that KERMIT-65 ("NR" edition) does. If I were to make an educated
guess, the problem might be that KERMIT-65 is using very short packets,
whereas the mainframe Kermit is using a much larger packet size and has to
"self-adjust" downwards. KERMIT-65 has a packet size of 94. You might try
adjusting the size of the data packet on the mainframe to match and see
whether or not that might help.

No, at this time there's no emulator to run 8bit software on the IBM...Now at one time there was talk (by DataQue) of a 130xe on a plug in card but it seems to have died due to lack of interest. I also understand that there is a way (maybe) to run 8bit programs programs through an ST emulator (kind of an emulator within an emulator). I've sent for information on the last one and if it looks reasonable I'll likely try one out (what the heck, I've got the right ST roms setting here anyway and thats half the battle).

Sorry I can't be much help

I appreciate Mr. McWilliams point of view. Ben should stick with
TurboFile and work out the bugs. I offer to try converting the
turbofile data files to PC File, if Ben can send them to me.
Ok. The 1025 is built like a tank. I'm just giving my point of
view. I still use my 8-bit, enjoy it very much. I was suggesting
not to put up with the Atari, if there is an alternative way.
PC file is very easy to learn and use. I suspect it will do
everything TurboFile will, and more. It and, say "Boxer" are
two shareware titles that Ben could use. PC File is a bit harder
to learn. He could still do his word processing on the Atari.
I never saw a decent data base for the 8-bit, maybe Turbofile
is one. I don't care for the 80 col alternatives on the 8-bit
either. Yes, I use the IBM for wordprocessing, data base and
communications. I still consider myself to be an avid Atari
8-bit enthusiast. The machine has certain limitations and
I don't bend over backwards to use it, I make it fit my
needs and preferences. I'm working on a pkunzip for the 8-bit.
Porting it from the only place you would expect. That requires
use of both machines.

There is still something that puzzles me...

In article <1993Jul2.193150.3536@cs.tulane.edu>, snyder10@convex1.tcs.tulane.edu (sherry snyder) writes:
|> I hate to break "Real World" news to you but there almost isn't any money
|> to be made in the 8bit world. Yeah you can point to the few Co. still selling

This is the part that "I still don't get". If you know that you can't make money in the 8bit world, why go through the trouble to acquire the rights to software that will never create a profit??? Please remember, this is just a question.

Remember, there are some 8-bit users who are just that. Users and hobbyists are not the same (even though many would argue that anyone who still uses an 8-bit is simply a hobbyist). The user will probably not be spending a great deal of time searching for software. If it is made known to that person that software exists and will make his/her life easier, they may purchase it.

Someone made the comment that who would want the rights to
a program and then not sell it....well this is what Steve
at Micromiser software is doing. He's still in business
making PC software; he's got the 8bit Atari in the garage
with 500 mixed up 8bit disks..That's what he told me last
month and if I wanted a module to a program bad enough he'd
send one of his programers out to the garage, assemble the
8bit, and go thru 500 disks to find it-> which would be a
charge of $200 ($50 an hour at a 4 hour minimum).
Also, his Turbobase has some screwy copy protection that if
and when you get your business application set up, in about
a months time a number appears on the main menu. Well if
this number isn't erased then in an alloted time then good
bye application! Only Steve knows what to do when the
numbers appear--I had one--and you have to send in a post
card that comes with the original program to have him tell
you how to get those numbers off the screen. Guess where
the codes to get the numbers off the screen are? In his
garage!
Anyway here's the adress and phone number:

From: jharris@cup.portal.com
Message-ID: <84832@cup.portal.com>
Source record: 106259

Thanks Ken, for starting this topic.

I've been getting several letters through EMail, (which I've greatly enjoyed -- Thanks!), and I thought some of the questions and responses have been interesting enough to be in public view. Here's an offer to field any questions you might have about me, what I've been doing, the Atari, the exagerated story told in Hacker's, who invented liquid soap and why?, or any other questions you might have.

I've still been programming the Atari 8 bit in the commercial world. I've made several products related to character and graphic display systems. During that time, there's also been several technical discoveries, and since I have been out of touch with the hobbiest world, I've been unable to share them with anyone.

To start with, I've recently solved a 12 year long debugging nightmare, that winds up being a bug in the 6502 processor, or possibly in Atari's mods to the 6502C chip. The clincher for me was the fact that this problem doesn't occur on a machine equipped with the 65816 chip. The problem is, and some of you may not believe me, the processor can intermittantly skip an IRQ or NMI interrupt -- presumably, if it happens at some particular instant where the processor is unable to respond to it properly. Although I don't understand why this situation happens, I am totally convinced that it is real, and that it does not occur with the 65816. If there are any interested parties, I'd love to talk about this in as much detail as you wish. I can also post a very small assembly source listing that will demonstrate the problem.

One of the more bizzare quirks I have run across, is a way to change Antic from mode $F to mode $E in the middle of a scanline! It gets even weirder, when you find out that this mode $E grabs the colors from different registers! I used it in my character generater to put multi-colored graphics next to hi-res text. The trick that does it, is switching to a GTIA mode, and back again. Just set up a mode $0F display list, and use a DLI to change $D01B to $40, and back to 0 in the middle of the screen. You'll have a psuedo mode $0E on the right half!

From my end, I've missed out on the entire development of 8 bit utilities for about the last 9 years. Two or three years ago, I was still using an original 800 with Dave Small's LE disk interface, and OS/A+ DOS! I know that sounds really strange, that I could be that out of touch, but there were reasons. I am now the proud owner of a Black Box, and SpartaDOS 3.2, (I don't like X, and it doesn't work well in my setup), and I am sure I have missed a ton of useful developments. I'd appreciate being informed of some of these, or where to look to find out.

I made some changes to the Hyper E: screen speedup program, that has made it much more compatible. This is listed as version 1.2JH, and was uploaded to Tom Hunt's BBS. Has this made it into general distribution? (I burned this into my OS ROM, so it works with programs that use the $E400 vector.)

To avoid this getting any longer than it already is, and telling a bunch of things that no one is interested in, I'll leave it to you to ask for more.

Thanks,
John Harris - jharris@cup.portal.com - Pac-Who?

2297. Re: Jawbreaker 2600 binary

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-07 04:32:19 UTC
From: jharris@cup.portal.com
Message-ID: <84833@cup.portal.com>
Source record: 106260

I'd really like some feedback on this one, if anyone gets it running. I personally really liked it, although I don't have a 2600 to see it on anymore.

There were two object files on my disk, one labeled JO, and one labeled JOF. JO stands for Jawbreaker Object, but I can't for the life of me remember what JOF is for. JO appeared to be the one that matched the source code, and so this was the one I uploaded. If you have trouble getting the game to work, let me know and I can try posting the other one.

During the project, I found a strange quirk in the VCS that cost me a lot of hair. It turns out that while the reset key on the VCS is held down, the 6507 is being reset over and over very rapidly, and on odd occasions, it jumps through the IRQ vector instead of the RESET vector! It only executes one or two intructions there before jumping back through the RESET vector, and it always ends up on the reset vector, but in the case of Jawbreaker it never got a chance to. Since the code was very full, I used the IRQ vector locations as extra space, thinking the VCS doesn't use IRQ's so these locations weren't needed. The bytes sitting there just happened to point to a non-existant place that locked up the processor before it got a chance to re-reset. This wasn't discovered until after a week of intense searching for a non-existant bug in my startup code, (what else could it be?!?), and finally the rental of a hardware diagnostic tracer that pinpointed the problem in moments.

On another strange note, this may be related to the skipped interrupt problem that I mention in my 'sound off' topic. Any speculation welcome.

The interesting thing here is I'd already agreed that this wasn't your point and that the root of you discussion was in different direction. So as the comment applied to the first discussion, you didn't get it...as to the second new discussion you did and I agreed with the root of your point of view. That still has not changed.
>
>There is still something that puzzles me...
>This is the part that "I still don't get". If you know that you can't make money
>in the 8bit world, why go through the trouble to acquire the rights to software
>that will never create a profit??? Please remember, this is just a question.

Why should this puzzle you...1. it's the right thing to do, that's just the way it is. 2. As you go on to say later in your posting, many of us are hobbyists, it's something we want to do for our hobby...An odd outlook I'll agree but it happens. Hay some of us want to try, we have the time, resources, and desire to do this. I'm not dumb enough to think that I can talk people out of copying software when there is nolonger a supplier/supporter...I just don't want them saying they do...Thats my point in a nutshell.

Tell ya what I'd really like to hear for everyone, is ways we as the remaining community can get these folks that hold (our?) rights to release 'em to the public or to someone like AC so that there can be a central point to store the source codes and maybe plan for upgrades and patches. Yeah its a dream, but what a dream!

Take care

Seconded, and I don't mean to be down on the PC (I own one and I also think we're all above "my computer is better than yours" nonsense). Every time I've become annoyed with the quirks and annoyances of an inexpensive program and shelled out big bucks for the high priced solution (or simply the popular one), I've been disappointed. It is much better to stick with the simple tools you know well, IMO.

I could rant, but I won't.

I don't know for Jaguars, but reverse splits are supposed result in
net equaity value losses about 80% of the time. Usually a good time
to sell then watch for a new opportunity after the dust settles...

>to use that? I'm sure Word Perfect for DOS is SOOO easy to learn,
>F1 is help isn't it? Or is it exit to DOS? Real user friendly, easy for
>Ben to learn. And hey, since we don't want to use the 8 bit anymore,

Perhaps .. it all depends on what enables someone to get the most work
out with the least investment in time and energy.

>we need a telecommunications program too, and umpteen million other things
>that already exist and work well on the 8 bit.
>
>The point is, the 8 bit works just fine. Switching to a PC will not make
>life easier. Most applications for the PC are more complex, and more of a
>headache than similar 8 bit programs. PC programs offer more features,
>but that's part of the problem. Unless you switch to Windows
>(i.e. MORE NIGHTMARES) Ben would have to spend weeks of time doing nothing
>but relearning how to use applications.

My point is .. as a _computer_ enthusiast who happens to be interested
in 8 bit Ataris since I bought a 400 for $400-600, I love the Atari hardware
and the conecpt of the original low level software interface ... but
I am not wedded to it. And I spend considerable money on computer hardware
and software, but find little reason to buy a new MIO interface or any
of the other hard drive interfaces when it is so easy and cost effective
to use my PC harddrive .. just slower (as far as the Atari is concerned).

>
>Ben's not a purist, he's a realist. He has a 286 sitting in the closet
>next to his 1040STE. He knows what works for him, and what is a waste of
>his time to deal with. Pretty much all 8 bitters are these days.
>

If he has a 286, my question is why isn't he using it? If he has one, he
must be at least acquanted with MSDOS. If it would be cheaper, or more
cost effective long term to move some applications to a faster platform,
why waste the obviously limited supply of suscriber dollars being a
purist? If it is a labor of love, and being done at least partially as
a service to the community, some thought should be given to efficiency.

>Jeff McWilliams
>Atari classics magazine -- "Moonlight Workshop"
>
>
>--
>Jeff McWilliams -->student, Electrical Enginnering, Michigan Tech. Univ.
>
>cd827@cleveland.freenet.edu OR jjmcwill@mathlab.mtu.edu

But then, if the effort is one to keep alive an almost dead piece of state of the art (8bit art) database software .. more power to him. But is it in the best interests of the magazine?

Perhaps a project like this would be better done thru a separate organization, group, set of books. It would be a shame to see the last Atari magazine die due to fiscal expenditures not related to its publication.

>
>Look ma, my 8bit, she ain't a toy no more!
>
>Mike
>Atari Archive Project
>Louisiana

Never was a toy <grin>. In my opinion, the Atari was originally the most
professional operating system around when it came out. Along with another

of my interests, the 6800/6809 Flex operating system, it was helped to loss of prominence by slow disk drive speed (which was subsequently somewhat addressed with the MIO type expansions, but too late).

Perhaps the question is ... is it in the communities/suscribers interest to prove that the 8bit is a _real machine_, to the detriment of the magazine? I, for one, always found it interesting that the '68 Micro Journal billed itself as the first microprocessor wordprocessed magazine ... taking articles from 6800/6809 word processing files and directly producing the magazine, but that did not induce me to suscribe, or add to my enjoyment and knowledge or value gained from the magazine. Nor will it induce me to suscribe to Atari Classics .. which I will do. (soon, honest!) I just wonder how long Atari Classic might be around.

Facts are facts, and people who buy an entire Atari system with hundreds of disks of software at a garage sale for $20 or such are not going to buy commercial software. They might suscribe to a magazine. And they might learn from that. They might even then join/support a software distribution club/organization. But should the magazine fund the later? Or fund its own publication?

Hola mundo.

Last saturday, the Stone Virus infected (and prosibly destroyed) the
hard disk of the PC connected to my subdomain unix network, so I
couldn't compile it again.

I only remember that I had to restore the crlf at the end of each line
in the .C source, the .ASM and the docs.

Then, I tried to compile it with TurboC, but I couldn't find an
assembler installed. Now I have the asm, but no c! :-(

I will try again this week in another PC.

Bye... ++V

PS: Does someone know a Virus for an Atari 8bit? I don't.

2308. 8-bit Atari stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-07 19:37:54 UTC
From: dam1@Isis.MsState.Edu
Message-ID: <21f8mi$9aq@Tut.MsState.Edu>
Source record: 106270

I have the following Atari 8-bit items for sale:

Hardware - 1020 color pen plotter/printer $10

Accessories - 1 Suncom Tac-3 joystick $3
1 WICO BOSS joystick $3
1 Atari 7800 joystick $3
1 set of paddles $5

Software on disk - Bank Street Music Writer $5
The Converter version 1.51 $5
Print Power $10
The Print Shop $15
RAMbrandt version 2.0 $10

Games on disk - Boulderdash Construction Set $10
Chessmaster 2000 $10
David's Midnight Magic $5
F-15 Strike Eagle $7
Hacker $7
Jawbreaker $5
Jewels of Darkness $5
Leaderboard Dual Pack $10
Master of the Lamps $7
MRCA Mach 2 $5
Pinball Construction Set $10
Quest of the Space Beagle (no docs) $3
Silicon Dreams $5
Trail Blazer $10

Books - Basic Atari BASIC $7
Atari DOS 2.5 Manual, $7

Magazines - ANALOG Computing issues 44(7/86), 45(8/86), 46(9/86), 49(12/86)
Antic: July, Aug/1985
Dec*/1987
Apr, Dec*/1988
* these issues include the disk

I also have over 50 ds/dd SpartaDOS formatted disks with
shareware/public domain/magazine software on them...

If you are interested in any of the above please contact me...

2309. Re: RGB monitor for 800

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-07 23:51:02 UTC
From: jim@octopus
Message-ID: <1993Jul7.235102.20533@jpl-devvax.jpl.nasa.gov>
Source record: 106271

Keywords: monitor, pinout, video

From the Atari 400/800 Hardware Manual: the video monitor pinout
(DIN 5, slot at the top, starting from 1:00 position:
1 - Composite luminance
4 - Composite video
2 - Ground
5 - Composite chroma
3 - Audio

A standard 5-pin DIN to twin RCA plug audio/video cable available at
many places will work fine if you have a monitor with composite video
input using RCA jacks.

John....I'm interested in anything you have to say..what you've
said so far is very interesting.
If you are running Sparta3.2d then you must get Wedge2.1; its
chock-full of useful utilities; it buries itself in the upper
memory of an expanded machine....you can't be using an 800 now
with the BB.
Which machine were you using the 65816 in?

One quick point... TurboFile is being acquired by Ben, not Atari Classics... It's my understanding that no AC funds were used to get the rights, AC funds are required for printing and mailing (and it sounds to be an almost break even venture even with 500 subs). I still agree with Jeff, Atari Classic is by, about and for Atari Users and it does mean somthing to me that the mag can be run from our Classic system. (yes I know layout and production are done else where but everything else can be done from the 8bit).

I too must be one of those wierd people...I still use my 130xe everyday. only need the mac to do page layouts and the IBM for AutoCad... Everything else I do with and through my Classic system. I understand what you're saying, I just don't agree with conclusions.

2314. Pirating...

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-08 04:54:32 UTC
From: "James King"@upl.com
Message-ID: <9307080454.AA06448@uplherc.upl.com>
Source record: 106276

<First.. I hope this is making it to the cross-posted USENET side>

Second.. I must be looking for trouble to get involved in this debate, but here's my $.02 anyway! <grin>

When is pirating actually pirating? If the company no longer exists as an entity and all the programmers have disappeared, died or left the planet.. Is recopying/distributing their wares still considered pirating or is it called survival?

My personal view of pirating is when a program is illegally cracked or duplicated WHILE the company still maintains a financial or personal interest in said program. If they careless (which is the case with about 90% of 8bit Atari software), then nobody is suffering damages.

Is this not correct?

If, however - we are to follow the letter of the law, then pirating is the duplication of ANY (c) software irregardless of the owners position. <--- Obviously, that law has to change as the time frame is WAY beyond that of being justifiable.

Also.. I'd like to defend G44 (Glenn Saunders). He is _NOT_ a pirate as Mike (at the Atari Archives Project) would paint him to be. Glenn is well known to me as an AVID and legal (and maniacal) supporter of the 8bit Atari. In fact, Glenn has gone WAY out of his way to secure hard-to-find/locate 8bit hardware & software for the sheer enjoyment of using this platform (and all these activities have been above board). On top of this, Glenn has championed many efforts to keep 8bit BBS based networks active (such as on Delphi, Pro! networks <my BBS included>, Carina Net, etc..)

As I stated in the first few lines.. these comments are my opinion only.. But we all know how opinions are (like Axxholes.. Everybody has one) <grin>

James King aka Kamaro Kid

Source record: 106277

Help! I recently came across a brand-new-in-the-box XEP80 (from Clay Walnum HIMSELF).

I'd like to locate the AtariWriter 80 package.

Anyone having this ORIGINAL (Covering-my-butt from Mike <grin>) package, please contact me.

Also.. Has anyone experienced XEP80 problems as I have? I'll be putting along at a mere 2400baud (my Hayes Ultra will push 19.2k throughput) using Bobterm (with the XEP80 .BTM module) when all-of-a-sudden my screen will push to the right.. As I put alone, my screen will continue to push even further to the right until no text is visible on the screen - forcing me to power-off-IPL my XEP80.

Any ideas?

This phenomenah occurs at least 10 times per modeming session and its really starting to annoy me!

2316. Re: Sound off with John Harris

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-08 05:23:11 UTC
From: jharris@cup.portal.com
Message-ID: <84936@cup.portal.com>
Source record: 106278

>How did you react when you first read Levy's book?

It took me a long time, about 6 months after I got it, to read the book. Mostly because others who read it first said I wouldn't be very thrilled by what got written. I was dissappointed. Steve Levy spent a lot of time with me and the other programmers at On-Line, took notes, and absolutely new the real stories. Why do journelists need to rewrite things to make the story more interesting? If they're going to make it up anyway, why go to the trouble and expense to gather real data?

While I did disassemble Super-Breakout and BasketBall, and discover PMG and some other machine secrets, bootleg copies of the Harware manuals showed up just a few months later. It was a strange because I thought I had information that no one else was going to know, and could use it to really have an edge in 3rd party Atari games. I couldn't help but feel disappointed that my 'edge' was taken away. Of course, that didn't last too long, because there was a whole world inside those manuals that I never would have found. After reading them, I was very happy to have that info available for myself, and everyone else. Instead, Levy told the story of the 'Wonder Boy' who figured it all out on his own.

I was not hoping Ken Williams could 'get me laid'. In fact, it was a cause for several arguments between he and I, as I constantly tried to get him to stop. Some of it was funny, like when we were in Lake Tahoe and I was drinking while under-aged. Ken said to one of the waitresses, "How would you like to go to bed with a rich twenty-year-old?" This time, my embarassment at thinking I was going to be caught under age overshadowed the usual embarassment. But both Ken and the waitress were apparently oblivious as to the remarks hidden content. Mostly, I was upset by Ken's attempts, and upset that Levy propogated them.

My wife and I did not crash Ken's party. And the largest stone on her engagement ring is a 1/10th carat sapphire. (Her own design) And the part about 'boy had she changed' was taken completely out of context. I was referring to the emotional feelings between us after being friends since we were 15. As with most other stories, this one has a funny side note too. A stranger hearing a discussion similar to this, looked at my wife's ring, and said, "Honey, if you married him for his money, you got screwed."

>And on an unrelated note, why did you get away from game programming?

A lot of trouble with On-Line, and Ken Williams, and a couple of failed attempts at programming a couple of games for Synapse, (for various reasons, some of this related to item number one), a failed startup company that I was a part of, and a crooked lawyer and accountant made me very depressed. When I recovered from all that, the opportunity that presented

itself first was a character generator that a friend of mine was working on, but he had to abandon the project. Mostly emotional reasons kept me from looking back for so long.

I do have at least two partially finished games that I could share with interested parties. Perhaps even find someone who wanted to help finish them.

>I'm curious about exactly what your setup is: additional RAM, mods, utilities
,
>monitor, what development software you use, etc. I eat this stuff up and I'm
>sure others will too.

Embarrassing, compared to my completely tricked-out 800. A stock 130XE, 128K, C= 1702 monitor (are there any others?) :-), 27256 EPROM for the OS, which I can switch between almost stock, and a custom ROM with my debugger built in. I can hold Select and Reset, and recover from crashed states. A BB with 10 Meg hard drive, but it's nowhere near full. (I love this 8 bit stuff!). I recently got an XEP80 box, but some features of my development system didn't work with it, so I'm rewriting that.

All my development software is custom, although some of it is modified from other people's programs. Synapse's internal PMG editor and character set editor have had several mods, and I really like the screen design utility built into the character set editor. It lets you draw char set graphic screens, including inserting/deleting rows and columns and moving things around. The assembler is a long story. I'll try to be brief. :-) I don't like Mac/65 because of the poor editor and bug/65. I still haven't seen the cart version, but I understand the editor hasn't been improved, and that's the tool I use most in a development system. I described some VERY simple changes that he could have made to allow full screen editing within the auto-number mode, and forward/back scrolling costing very little memory. (I believe these changes were 100 bytes or less). The author was completely uninterested in any improvements, saying things like, "I don't *force* you to use the built-in editor." And, "It's no problem, because Mac/65 is so fast." He said that one at least 4 times during our conversation. Well, I rate speed a little differently, because I'm interested in the time it takes to develop a product -- I spend a small portion of it waiting for the assembly process, and that's not what needs to be the most important step IMHO.

I had already started my own project, which began life as MAE from Eastern House, and decided to continue with it. I've added lots of features, and made the existing ones easier to use. The assembler and debugger are integrated, so that I can use the symbol table and single line assembly in the debugger. It smaller and lots faster than the original, plus it can be relocated anywhere in memory. I assemble my software directly into a RAM based version of my bank select cartridge, so having the assembler elsewhere is a must. (The reason SpartaX doesn't work for me.) The best thing about it, is that if I ever catch myself thinking, "I wish it would do this", I get out the source code and make it do that. :-) It's not Mac/65 as far as raw assembly speed, but it's probably the second fastest

assembler. I normally program in modules of about 2K-4K, and these assemble in 10-20 seconds, and thus I just don't need anything faster. Mac might save me 15 seconds on an assembly, but it would cost me tons of editing time. Not having block moves alone would cripple me. (Doesn't anyone else move code around when branches go out of range?!?)

I'm sorry. I didn't keep this brief.

I just finished upgrading it to full 65816 capability, and am in the process of finishing a new editor that will work with the XEP80. It's full screen oriented, and has some neat stuff. Like pressing a key will look at the operand of the current line and take you to the location where the label is defined. It also sets a bookmark where you came from, so you can return with another key. Like an editor's version of JSR & RTS. Plus a multi-line undo, single key line duplicate, and other things I can't remember. Let me know if anyone wants to beta test this editor a bit. The current snag in the assembler, is that the debugger has not been upgraded to 65816. Does anyone have a source for a 65816 disassembler?

I discovered this by accident, since I was trying to put a GTIA pic on the
left, and hires text on the right. The chips apparently won't do this, and
you wind up in the wierd mode $E instead.

I'll look for this. Except, it might be in the upper memory spot that I patched 3.2d to use so that I could get a 1K lower MEMLO.

>Which machine were you using the 65816 in?

I don't want to start any rumors about this one. It might be September or later before I can talk about it, but it's not for the mainstream 8 bit users unfortunately.

Related to this, has anyone done any improvements to the XEP80 driver software? There is at least two bugs when getting lines from E:. Trailing spaces are not truncated, and if you move the cursor to a different line, the logical starting column isn't reset to 0. (i.e., the computer prints something, leaving the cursor after it. Doing a get from the E: device will return only the characters past this point. Except, if the cursor is moved to a different line, E: should return the entire line in this case. The XEP software applies the same position chop as the original line.)

Or any other general improvements, like removing the P: handler to save space, or relocating to lower memory. I have it successfully running at $1900, but that wastes all the space from $1819-$18FF. Their relocating format doesn't appear to allow both high and low byte relocation.

I find it hard to believe the SpartaDOS author couldn't save $19 more bytes, but oh well...

Richard,

In NO WAY is Atari Classics subsidizing the acquisition of Turbofile
from Micromiser Software. This acquisition is paid for by Ben, out
of the money he's saving by refinancing his house, not from people's
subscriptions. Atari Classics money goes solely toward the magazine.

But let me say this: as I read your post, I became really dismayed
due to the underlying message it sent me.
Ben put up a LARGE sum of money to get Atari Classics
started. Myself and the rest of the campaign crew sacrificed a lot of
our own personal time running the campaign which led to the creation of
Atari Classics in the beginning. Ben spends 30-50 hours a week doing
nothing but handling Atari Classics business. He averages 5 or 6 hours
of sleep per day. Nutritional needs have been fed via instant nukable
food. This has taxed his system severely, and it showed on his most
recent health exam where he works. The bottom line given to him by
his company is, either he gets himself back into shape, or he faces
the possibility of getting shit-canned.

if you're so worried about Ben taking funds from Atari Classics,
how come you gave no consideration for the 300-500 dollars per week
that Ben could rightfully claim for the services he provides to A.C?
And beyond that, if procuring Turbofile ensured the continuation
of Atari Classics, what would be wrong with A.C. funding its procurement
so that source code could be obtained, bugs fixed, enhancements made, etc?

If the 8 bit is so incapable, do you expect Ben to pay out of his own
pocket for a PC and a host of software for it?

If you're really not happy with the way Ben is performing his duties,
feel free to find another who is as dedicated as he is.

I am really REALLY trying to control my anger here, to keep from
frothing at the mouth.

I tire at continually hearing how terrific the PC is, and how poor the
8 bit's capabilities are at doing jobs it can do perfectly well.
You PC people MUST stop listening to all the pro-Intel propaganda out
there. Just because a machine isn't a 486DX2-66 or a Pentium, does NOT
mean it's incapable. Ben's database running machine is a
256K 800XL, with a 44meg Syquest Removable media drive, 2 dual drive
XF551 floppies controlling 720K and 360K mechanisms, and 2 1.44 meg
PBI driven floppy drives.

Atari Classics's database computer is running on a machine that is
a FAR cry from a 48K 800 with an 810 disk drive. Turbofile is VERY

capable. With the program running under BASIC XL, and the majority
of time critical stuff written in machine language, T.F. has no trouble
handling the needs of the Atari Classics subscriber database.

Running A.C. off of an Atari 8 bit isn't a question of purism.
As I said in a previous post, several factors contribute toward
porting the A.C. database over to a PC unfeasible:

Transferring the data from Atari/Turbofile to a PC with some
database whose file format isn't even known.

Dealing with the learning curve of the PC architecture, DOS,
the Database

Finding a place to even put such a beast in Ben's office crammed full
of papers, subscriptions, letters, magazines, manuscripts, A.C. program
disks, etc.

Oh sure, YOU may say PC File is an easy database to use, just as I might
tell my wife how easy UNIX is to use. Gee, simple to me.
No problem using "ls -l | grep ARC | lpr -Pmath "
to do what I want eh?

Jeff

Hello !
Can somebody tell me how to connect my Atari 130XE to PC 486DX ?
I'd like to do it in some very simple way, because I have no modem
for Atari and I don't want to buy it. I have only disk unit with single
density.
I want to copy my files from Atari to PC and (if possible) to use
Atari as a terminal for PC. Is it possible with only some cable
(without additional interface) ? Ho to plug it in ?
What is the simpliest way ? I'd vert happy if anybody answer me.
But I know only very little about Atari hardware, so tell it very
simply, please !

The easiest way to communicate is with a null modem. You can get a null modem (just crosses some wires of the serial port and keeps some straight thru) at any good computer store. Then you need a cable long enough to go from the little null modem to the other computer. You would need a P:R: connection, 850, MIO or BB to use a regular rs-232 hook up. Then use Comm. software at both ends and let her rip.

Gee, and coincedentally just last week I spent a day thinking about what hardware would be necessary to make some dynamic RAM look like a many track floppy drive to a system for easy replacement in _any_ type of computer (more specifically my floppy only laptop). That would not be too hard ... the problem would be making it small (for the laptop) and low enough in power for batteries to be reasonable. Now for a _normally_ AC powered setup (drifting off to the design land in the mind) ....

>I'm sorry. I didn't keep this brief.

No, no, no, don't try to keep it brief! You almost certainly know
the 8-bit machines better than anyone currently using them. And
what you say is _interesting_; over the last five years or so there
has been a steady decrease in programming the Atari computers and
more of an emphasis on hardware upgrades. Hearing about someone
actually doing amazing new things (without any doom & gloom) brings
back some of the spark of the Olden Days (TM).

Any chance you will release your assembler/debugger (either commercially
or as shareware)? I've thought of finishing up some old programs,
but MAC/65's editor give me the willies.

Why have you stuck with the Atari machines all these years? Wasn't
there ever any pressure to work on the Amiga or another computer?

>

Great .. that was the spark of my post.

>But let me say this: as I read your post, I became really dismayed
> due to the underlying message it sent me.
> Ben put up a LARGE sum of money to get Atari Classics
>started. Myself and the rest of the campaign crew sacrificed a lot of
>our own personal time running the campaign which led to the creation of
>Atari Classics in the beginning. Ben spends 30-50 hours a week doing
>nothing but handling Atari Classics business. He averages 5 or 6 hours
>of sleep per day. Nutritional needs have been fed via instant nukable
>food. This has taxed his system severely, and it showed on his most
>recent health exam where he works. The bottom line given to him by
>his company is, either he gets himself back into shape, or he faces
>the possibility of getting shit-canned.
>
>if you're so worried about Ben taking funds from Atari Classics,
>how come you gave no consideration for the 300-500 dollars per week
>that Ben could rightfully claim for the services he provides to A.C?

None of above deleted due to appreciation for the sacrifices _time_
envolves for all of us. Volunteer work is _real_ work, no matter
what direction it might be directed. And when out of pocket expense
is included, even more respect is due those who volunteer.

>And beyond that, if procuring Turbofile ensured the continuation
>of Atari Classics, what would be wrong with A.C. funding its procurement
>so that source code could be obtained, bugs fixed, enhancements made, etc?
>

My point was directed to efficiency issues .. what is cost and time
effective ... effort directed to software publishing to the detriment
of the longevity/survival of the magazine is what I was questioning.
We all have limited resources, and I for one appreciate it when people
question how I am prioritizing my own distribution of time and finance.

>If the 8 bit is so incapable, do you expect Ben to pay out of his own
>pocket for a PC and a host of software for it?

Only if he wants to .. he apparently is paying out of pocket
for the software rights .. I was recommending careful consideration.

>
>If you're really not happy with the way Ben is performing his duties,
>feel free to find another who is as dedicated as he is.
>

As I am sure you know .. fat chance of finding someone else as dedicated.
I _DO_ appreciate the degree of effort Ben is putting forth on behalf
of the Atari 8bit community.

>I am really REALLY trying to control my anger here, to keep from
>frothing at the mouth.
>

Please don't be angry. I am not trying to start a PC based religious
war here, just bringing up concerns and alternatives.

>I tire at continually hearing how terrific the PC is, and how poor the
>8 bit's capabilities are at doing jobs it can do perfectly well.
>You PC people MUST stop listening to all the pro-Intel propaganda out

I must correct something. I am not a PC person. I personally dislike
the Intel architecture and command set immensely. Worse are some of
the rings you have to jump through for the MS DOS operating system.
But, PC Compatibles are cheap, and offer a great deal of performance
for relatively little money. So I use them. But this does not mean
I like them.

<specific system Ben uses info deleted>

A bird in the hand is always worth two in the bush. (Someone did mention
Ben also has a 1040 and an XT in the closet .. but Ben must use what
_he_ decides to use)

> Turbofile is VERY
>capable. With the program running under BASIC XL, and the majority
>of time critical stuff written in machine language, T.F. has no trouble
>handling the needs of the Atari Classics subscriber database.
>

Except for some bug .. which Ben would like to see fixed.

>Running A.C. off of an Atari 8 bit isn't a question of purism.
>
<deletions regarding considerations involved in the decision to use 8bit>

Good .. lots of good reasons to keep running it on the Atari then.

>Oh sure, YOU may say PC File is an easy database to use, just as I might

I personally have never used PC File. I have used 8 different
databases on 5 different platforms, so am aware of what must be
done to move applications from one to another. All are generally
in the same ballpark as to general ease of use, user interface
quirks are sometimes the toughest to learn.

>tell my wife how easy UNIX is to use. Gee, simple to me.
>No problem using "ls -l | grep ARC | lpr -Pmath "
>to do what I want eh?
>

(personal opinion .. don't want to start a war) Certainly easier as
in faster than trying to wade thru an MS DOS based menu system, or
Windows based menu system, once the initial learning is finished.

>Jeff
>
>-- Via DLG Pro v0.995
>

Jeff,
I was only suggesting alternatives. Money and time are limited commodities
for all of us, and something that is in place and working is adequately
is almost always a good choice. Apparently there are problems with the
software in the current setup. So a solution is being sought. And I
suggested careful consideration of alternatives to a pure 8Bit approach.
My opinion is colored by my own experiences and uses, which cover a lot of
different equipment, and that which I am fondest of tends to be bypassed
by the marketplace. (trying to clear head -- screaming -- I HATE INTEL
PROCESSORS!!) (phew -- back to calmness). I use, and recommend that people
use, whatever works for them. And I try to help out where I can with
suggestions. Ideas are the life blood of people, and I want only to help.

From: snyder10@convex1.tcs.tulane.edu
Message-ID: <1993Jul8.143728.10000@cs.tulane.edu>
Source record: 106290

>When is pirating actually pirating? If the company no longer exists as
>an entity and all the programmers have disappeared, died or left the
>planet.. Is recopying/distributing their wares still considered pirating
>or is it called survival?

For what ever reasons there are people that are holding back the rights
from the Atari community. The point is, everytime we jump on a national
network and say we're going to copy something all we do is justify their
position... Let's face the fact here, what we want is more than just the
right copy and dist software, we want the source code too....

>My personal view of pirating is when a program is illegally cracked or
>duplicated WHILE the company still maintains a financial or personal
>interest in said program. If they careless (which is the case with
>about 90% of 8bit Atari software), then nobody is suffering damages.
>
>Is this not correct?

As I've said before, and I'll say again, I see it a mostly a black and
white issue... The copying and dist of copyrighted software (or whatever)
is what it is...

>If, however - we are to follow the letter of the law, then pirating is
>the duplication of ANY (c) software irregardless of the owners
>position. <--- Obviously, that law has to change as the time frame is
>WAY beyond that of being justifiable.

Now, this is a point I'm willing to agree on, Patents as opposed to copyrights
for software. That way, after a set period of time, we as the public would
have access to it, no as in the current system where we must wait 50 yrs past
the death of the owner. But now we do get into the fuzzy zone...should
software be copyrighted (is is currently) or patented?

>Also.. I'd like to defend G44 (Glenn Saunders). He is _NOT_ a pirate as
>Mike (at the Atari Archives Project) would paint him to be. Glenn is

I'm not going into this again...Glenn and I have covered this issue and have
at least to my mind, reached an understanding and have resolved the point and
moved on. I know of Glenn and what he's been up to, I know many of the
good things he does for the 8bit world, so don't come up and tell me how
I "Paint" people...Glenn and I disagree on one point and my position has not
changed. Don't know if you are reading an old feed or what, but if I were
to have called Glenn a pirate, I'd never have let up. What I did say, however
was that his proposed actions were those of thief...and then I went on to boar
the hell out of everyone as I made example after example.

No, Glenn's a good guy who's just as frustrated as I am about the way things are, and just wants to do something to fix it. We all say the wrong thing from time to time...Hay, you and I are no different.

>8-bit Manager of Delphi
>Exchange Editor for Atari Classics &

2334. Micromiser purchase apoligy

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-08 14:54:11 UTC
From: rdell@cbnewsf.cb.att.com
Message-ID: <C9upEC.BKF@cbfsb.cb.att.com>
Source record: 106293

I want to apoligize to Ben and to Atari Classic magazine if anyone here is getting the idea I have suggested it is _wrong_ for them to purchase the Micromiser software. I was attempting to question the thought process, and certainly do not intend to suggest what was _proper_.

It has also been made clear that the Micromiser purchase is a personal project of Ben's, and as such, my suggestions are useful only towards maxamizing Ben's own resources, and probably are inappropriate coming from a complete stranger such as myself.

Computers and software are only tools, and are only useful insofar as they enable one to do something better. And better is different for every individual.

Ben, good luck in whatever course you pursue in this regard. I hope whatever input I have contributed was useful, and not a hinderence.

IMHO: It's infinately do able, but...
1 meg sims still go for about $30 ergo a 10 meg'r on the bus would cost
upwards of $400. If you switch to static RAM, it becomes even more
expensive. Let's face it, if you offered 10 megs of storage to people for
$40 I doubt if 1 in 10 8-bitters would byte.

This isn't exactly what you're looking for, but the folks who own Genie are willing to sell it to anyone who'd like to reintroduce it and try to make a buck. I've not asked them how much they want, so it could be entirely unrealistic, but it could also be trivial. If anyone out there wishes to pursue this with New Horizons, I'll be glad to serve as the middleman in setting up contact. They went off into the Mac world years ago and were surprised to hear from me that there is still an active (if small) Atari 8-bit community.

Am I the only one around who still uses and likes Genie?

Richard,

Thanks for understanding where I was coming from. I got a little emotional there, which is something I try not to do. I appreciate where you're coming from, and I too believe it's a good thing to re-examine operational decisions every once in a while. After all, that's how progress is made, and how stagnation is avoided.

Despite the headaches involved in transferring software from one party to another, including source code, technical specs on the data formats of the various files and stuff, Ben has decided that it's the best route to go. Myself being intimately familiar with Turbofile and the needs of Ben in regards to keeping the A.C. database running smoothly, I've agreed to dedicate myself to eradicating all the bugs in the program that I possibly can. Who knows, along the way I may even decide to write some additional modules for Turbofile that increase its usability even further. I wouldn't really expect to profit from this, Mike Todd has covered the profit motive enough so I'll not go into it in detail. But I would really enjoy continueing to hone my programming skills by beefing up Turbofile.

I'm thankful this didn't turn into a flame war; I was afraid it was heading in that direction.

Jeff

: model AT88-S1PD (has several rows of what appear to be jumpers; how are
: they used?)

Your AT88 is a single sided, single density atari SIO disk drive. This
drive can be upgraded to double denisty with Percom's

DATA DOUBLER - a card that slides in some where on the PCB board.
Your drive might already have this installed. I picked one up a couple
of years ago, and it was already double density, but had a behemoth single
sided, full height floppy.

IMHO, these are the BEST drives you can have for your atari. They simply
interface your SIO with the standard IBM types of drives. Meaning, you
can simply rip out whatever floppy mech is in there and slap in up to four
IBM drives of your choice- 360K 5 1/4 is what I put in- but you could just
as easily put in 3.5 720k flippies. Or mix and match. Just make sure you
have the double density!!! They are really great great drives. WEll, I guess
I mean interfaces, cause the drive are as good as you can supply!

I MAy actually have the "DATA DOUBLER" if you are interested....
If you are let me know... if your want to get rid of them (at least the 88)
let me know also..... As for the other drive, I have no idea.....?.?.???

Ulli,

Antic Magazine went under several years ago.
I believe that if you want around comp.sys.atari.8bit long enough,
the FAQ will be reposted, which contains among other things, a list
of all magazines, local and foreign, which still support the Atari 8
bit line of computers. Atari Classics is the newest comer. A magazine
for, by, and about 8 bit Ataris. 6 issues per year, with an optional
program disk with every other issue. We currently have 497 readers
worldwide, and we're still growing.

A subscription in Germany would cost you $32.00 US for 3rd class mail,
or $38.00 US for airmail. The software disk would cost an additional
$9.00 US.

Atari Classics

>>I'm sorry. I didn't keep this brief.

Ok guys, I really don't need that much encouragment. I'm a real motormouth when it comes to the Atari. :-)

>Any chance you will release your assembler/debugger (either commercially >or as shareware)? I've thought of finishing up some old programs, >but MAC/65's editor give me the willies.

Yes. I'll post the new editor within the next couple of days. It's not integrated into the assembler yet, so that will be a bit longer.

>Why have you stuck with the Atari machines all these years? Wasn't >there ever any pressure to work on the Amiga or another computer?

The short answer, is because I still love it. From there, it gets into more mundane reasons like being less expensive, and Amigas until recently didn't have built-in composite output.

Several of my projects, we provide the hardware to the customers for free, and charge a monthly fee for programming. Having an inexpensive machine is a great benefit in these cases.

I really thought hard about switching to the Amiga. I have one, and like it as a general computer. I'll probably stay where I am though as long as I can.

I have lost very few sales due to inferior video quality. In fact, I have come up with my own defination of 'broadcast quality' as I have found it in the field. It means, "Whatever the engineer is willing to hook into his system." It is been an incredible thrill to see some of the hardware I have replaced with an Atari. At Oceanic Cable in Honolulu, (a very major system), they had a $40,000 PC based system with SVGA, multiple video cameras, and all kinds of stuff. No one could figure out how to use it. It's now sitting idle, and my Atari program is putting up more interesting stuff than they've ever had on that other system!

As easy as I like to think the system is to use, I had a really funny experiance with the Defense Departement. (I wish I could have heard this call instead of my partner). We got a customer service call, and the guy wanted to clear the screen so he could type new information. Well, my partner told him to press Shift Clear. He says he tried that, but only got a little symbol on the screen. So my partner clarifies, "You have to continue to hold the Shift key down and then press clear." This is what he heard from the other end. "HEY! Yeah, YOU! Come here for a minute. I'm going to hold this key down, and when I tell you to, press this one. OK, ready? Now. Okay, okay, I got it cleared." :-)

Perhaps it's best I didn't handle that call, since rolling on the floor laughing might not be so good for business.

Source record: 106108

Ok, here it is. The demonstration of the interrupt problem in the 6502. Oddly, it doesn't even have to use an IRQ, as the software BRK in this example shows. Results are the same, no matter which IRQ and NMI we are talking about. Anything can get skipped.

Note, that this is far from the most extensive tests I did for proof. It is in fact the simplest test I could reduce it to, and was the one I used to try convincing other people, (i.e. ones with resources to help me figure out what the heck was going on), that the problem was not my imagination, or poor programming.

```
LDA #<DLI
STA $200
LDA #>DLI
STA $201
LDA #<BRKLP
STA $206
LDA #>BRKLP
STA $207
LDA $230
STA $80
LDA $231
STA $81
LDY #8
LDA #$82
STA ($80),Y ; Put in a couple DLI's
LDY #$17
STA ($80),Y
LDA #$80
STA $D40E
BRK ; We should now jump through ($206) -> BRKLP
;
BRKLP LDA $D20A ; These first 5 lines are just to get a random
AND #3 ;element into the timing. Without them, it is
SEC ;possible to run a fixed loop that always
DELAY SBC #1 ;misses the critical point of timing.
BPL DELAY
PLA ; Pull all the stuff that the IRQ pushed
PLP
PLA
PLA
BRK ; This should be an infinite loop to BRKLP
;
INY ; This line is never executed.
LDA $2C8 ; But it occasionally gets here, and I change the
```

```
CLC ;border color.
ADC #8
STA $2C8
STA $D01A
BRK ; Back to the loop
;
DLI PHA
LDA $D40B ; Use the line counter to get two different colors
STA $D018 ; I didn't use WSYNC to eliminate it as a variable
PLA
RTI
```

Ok, the DLI's put two new blocks of color on the screen. What you'll see if you run this code, is these blocks will flicker, as well as the border color. This is because both BRK's and NMI's are being skipped. The Y register never changes, which means the program gets to the $2C8 color change without going through the INY. This address is equal to the address of the BRK, +2, which is the address that gets pushed onto the stack when the BRK is executed. I'm about to show how it gets to that address.

There's 12 years worth of data to describe about my testing this phenomena. Here's the highlights:

At the peak of discovery, I disabled the OS ROM, and put the BRKLP and DLI pointers directly into $FFFA and $FFFE. Eliminate more variables. I also slowed the BRK loop way down, and put counters, both frame and VCOUNT into both the BRK and DLI interrupts. I also put some checks into the DLI to see what the stack looked like. Now this is really neat. At the point of the error, the stack from the DLI contained only one return address, and this was the address of the BRK +2! Also, the B status bit was set in the pushed status register! Now, the BRK +2 address is never executed in the normal loop of code, and thus BRK+2 should never be pushed as the result of an NMI. The data logs showed a gap in the counters for the BRK loop, and that gap corresponded exactly to the DLI that logged the odd stack frame. That, plus the fact that the B status was set leads me to believe that the two interrupts somehow got 'fused' into one. The 6502 is processing the BRK internally, but before it jumps through $FFFE, an NMI comes along and somehow revectors the jump to $FFFA without pushing new stuff on the stack.

The Zaks 6502 book mentions some vague stuff about setting the I flag as part of an IRQ so the processor isn't interrupted while it is manipulating internal registers. But that doesn't stop an NMI. What happens then? It also talks about accepting the interrupt as soon as the current instruction is completed. But what if that instruction is another interrupt? I don't know what the actual conflict is caused by. But I think I've shown that it occurs.

All responses to this will be most appreciated. This problem has cost me months of debugging time over several different projects trying to find bugs that didn't exist. It has been an obsession, and I'm eager to talk more about it.

Hola mundo.

The way that kind of 'chains' works (to really make money) is that
a guy must send some money to the first guy named in a list. Then
remove him from the list, place his own name at the end of the
list, and send a copy of the revised post to a number of friends.

So, why post throught a newsgroup?
Are you willing to obtain more than a n^n (n**n) bucks? (n is the
number of names in the list).

Let the number of guys in a newsgroup be m, so, if each of them
selects another different newsgroup, and every selected group
also has m members, then it is very dificult to reach the pole
position if m>20 and n=5. There are not that number of global
newsgroups in the world (m*m*m*m*m) without sending twice to
a group.

Only the first name and probably the second will receive money.
If so, there are no reason to send money to the first, if you
won't receive a coin.

The above is what I had to say...

BTW: If n=1, you would receive 1 buck.
If n=2, 2*2=4 bucks.
If n=3, 3*3*3=3^3=3**3=27 bucks.
If n=4, 4^4=4**4=64 bucks.
But, if n=0, 0^0=0**0=1 buck you wold receive from nobody.

Bye... ++V

Back when Steve Ciarcia wrote for BYTE (when BYTE was worth reading)
he once commented that "physical ramdisks" were one of the suggestions
he received most often. "Too expensive" was the reason he gave then
and I guess it's still true (just imagine how much it would have
cost around 1985 or so!). There *are* some companies selling such
contraptions for the PC, but they are usually not worthwhile.

I was just thinking about my olde atari 8-bit. Sad to say, but I haven't
touched the thing in a few years. I was just wondering what to do with
it. I used to be a pretty good programmer on it after all. And I've got
a 130 xe and 2 doubler drives sitting around collecting dust. Hmmm.
Anyone got any ideas? I was thinking of boosting the 130xe memory-wise
and using it as a printer buffer. Does anyone know if this will work?
Has anyone done this? The problem I see is losing characters while printing.
(Losing chars from the PC that is) can incoming chars trigger an interrupt?
Will placing this data in extra memory screw up transmission?>
In any case this would be more of a "hobby" project since I rus os/2
on my PC which supports spooling. ;-). Hmmm.. mabye I could make the
atari interpret postscript for me and I can print postscript stuff!!!!!
Nahhhhhhhhhhhhhhhhhhh......

Hola mundo.

I have an illegal copy of MAC-65, and I also modified it up to my needs.

Then: Are the programs I have developed using that assembler ilegal?
Just the generated executable code?

This question applies to any development software that produces executable
code without any library or run-time code appended to the output, and
also for the programs that remains as source but pre-processed (like
Microsoft Access for Windows's sources remains in a .MDA database file,
tokenized I think).

I plan to use mine as dedicated I/O terminals for my home automation system. Hooked up to a whole-house video system, with an RS-485 network port (via two of the 800's joystick ports) and a Xanadu Zapper (IR transciever device) connected to the other two joystick ports, plus a custom developed program burned into a ROM and plugged into the cart slot, I'll have a nifty (and inexpensive!) way to send commands to and receive status reports from my smart house - I suppose you could sum it up as On-Screen Programming for the House. ;-)

Does anybody have the pinnout for the power connector for
the 800xl? I have one that doesn't work right now and I'm
trying to figure out if it is the PS or the computer. The
only sign right now is that the power light does not come on
when it is plugged in and turned on. Anybody got a service
manual? Will atari repair the machine for less than a
small fortune?

Thanks!
Chuck

2358. Clarification

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-09 19:47:02 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <21khvm$nrj@usenet.INS.CWRU.Edu>
Source record: 106119

I would like to clarify a few things. I said I don't use my Atari 8-bit for word processing, data base or communications any more. I do some wp and comm, but the IBM is my main unit for those two. I also said I consider myself an avid 8-bit enthusiast.
I own a number of 8-bits and use them all variously, if for nothing more than compatibility checks. I am constantly doing something with the 8-bit. Some of my latest projects. I fixed 'Popcorn' so it didn't clobber DOS and had better joystick control. I wrote an article I submitted to Charles Cole for 'AC' consideration. I wrote a disk cataloger to catalog conveniently hard drive or disk collections. These are just a few of hundreds of projects I've enjoyed doing and still do. I want to make an unzipper for the 8-bit. The hangup right now is that the IBM Pascal source I have has data types that Kyan Pascal doesn't do. Specifically, longints. I don't know how they are stored. They probably are capable of plus and minus numbers. I know they are four bytes long. I am trying to figure a way around buying Turbo Pascal 7.0 for $100.

Russ Gilbert

2359. Re: The Smart-Alec Idea Depatment

Newsgroup: comp.sys.atari.8bit

From: mark@godzilla.quotron.com
Message-ID: <C9x0C3.1xF@quotron.com>
Source record: 106120

One of the important things to remember about "Physical" RAM disks is that they don't have to be extreemly big to be really useful. An example of this is the MIO. When I was still an active developer, this sped my coding immensely -- and mine only has 256k! I didn't keep everything sitting on it for long periods (days or weeks) though -- I just reloaded it every time I started up & saved when I was finished.

Also, an alternative to just plain external RAM: how about an interface to read/write flash-cards like those used in the Atari Portfolio? You could even set it up to use a format compatible with the portfolio or IBM PC/laptop.

I have sseveveral projects I'd like to discuss here, and get advice on.

1) First, and most relevant to the newsgroup, is a possible_possible_ cross
netwwork between cInfo-8 and Carina through a local board which ovffers
both QWK and interenet email services.

If this kicks in, the moderateor should be aware that there will be
ONE LARGE MESSAGE split linto seinto sumbbmeessages with headers from the
various people on my and other boards, aprobably in a unique
header lookformat so it cais seasily recognizable.
It would scre w up the threading to some extent, but what can ya do?

Also, it should bealeesso be noted that it might enlarge the traffic of
nthis newsgroup to a great extent, as I can see 4 boards initially
being in the net, and many more to follow.

I am would like some feedback on this idea, because aside from
the messiness of it, it would really help bring this newsgroup
"to the peopl"e" and out a the mainframes.

2) I plan on making a newsletter ofver the summer. I can't give
too many details of what will be in it, but you can be
sure that there will be somewill be a picuture of my 1400XL on othe cover
and an indepth article on my quest to bring it back to life.

Also, there are some programmers local to me I would like to
internview, and I could also accept articles from othersany other
interestedperson wwith an idea.

The motivation behind doing this is:

A) to do all the DTP work on an 8-bit!

B) To be able to put something goteogether without hbeing asslave
to a prublisher, or some deadlines, or a set number of
issues per year.

C) to distribute informationexclusive infomrmation I have acquired over
my 1 year hjourney through tleelecommunications.

Here is how I would market it when complete:

I wo I would make a COLOR cover, with a pic of my 1400XL
on the cover, and the bare motherboard on the back, probably.
I would do all the printing out of CopCopy Cop or similar printers on a
1 weekly basis based on the number of requests for copies.

I would not make a massive run and hope to sell them all,
I would only make as many as I have orders on hand.
I would charge enough to break even and that is it.

It It will probably be a bit pricey, since you get better deals
with MASS printings and stuff, but if people want something special
then they have to pay what it costs me to do it.

I sI am now Please le t me know what you think of this too, and an.

I qoulwould also include a disk with interesting projgrams I have
picked up that few people havel...

3) lastly, I am probably going tgoing to start a "what the hell" petition comampaign
to get ATARI to release their prototype gamews s they were developing
at the end of the XEGS ir 8-bit support days, including Xenobpohhobe.

This would include any source code as well, so that it may be
whipped up into shape and reburned into new bank switched EPROMs.

In the deal ATARI I would want ATARI to those sisigning the petition would agree to
purchase what ATARI
has left, and and/or contribitute to a buyout of the rights
of these games.

The namesNames and addresses wouldbe ta be taken anc d compiled with DISKBASE on my
hard drive.

I don't know if anytheining can come of this, but I think ATARI should
at least know that hthere are some piessed-off people, who are
at least organized enough to "picket" them and also are
smart enough to wave some cash their way.

If you guys think this too is a good idea let me know how I
should wriphrase the letter, that is the next step before accepting names and add
addresses.

>
> dave
>
Dave,

Could do it easy with a 2nd PIA chip either on a card that plugs
into the CARTRIGDE & ECI ports, or something internal.
You printer basically runs off of about 10 wires:
8 data lines, strobe, ready, and ground.

A waits for ready to be active, then sets up data on the 8 data lines,
and pulses the strobe signal. Ready will go inactive momentarily, and then
you can loop. That way, no characters are ever lost, else your
dot matrix printer connected to your PC would lost characters all over
the place. The 6520 PIA chip has just what you need, 8 input lines,
and CA1 and CA2. You can set up one of the CA1/CA2 lines to detect
a pulse on strobe, and active an IRQ interrupt on your 8 bit.
You would then set the other wire to inactive, which is READY, read
the data from the PC port into your 130XE printer buffer memory area,
and then reset READY to inactive and start all over. Of course, you
also need a routine running which then takes the incoming data
in buffer memory and sends it back out to your printer. The 6520
has two sets of ports like this, so no problem using one set as the

PC<->130XE line, and the other set as the 130XE<->Printer link if you
don't already have an SIO printer cable or something similar.
As far as interpreting postscript, they use high speed RISC processors
in laser printer to do that stuff. I really don't think you want to try
to turn your 130XE into a postscript interpreter for your Plane
HP compatible laser printer, or dot matrix printer.

Scott,

Hey, that sounds really cool. You really went over my head with some
of this stuff though. Never heard of the RS485 port, or the Xanadu
Zapper. Yo ARE gonna share this with the rest of the world aren't you?

There was a set of articles in Analog Magazine a few years back that
showed how to turn one of those BSR Home Controller thingies from
Radio Shack into a device that you can run from your 8 bit. That
way, those plug in light, wall outlet, and other modules could be controlled
by software. Man, combine that with the Covox VoiceMaster Junior that
was out years ago, that did voice recognition, and you have your very
own HAL 9000 running your home! How about this: you really don't need
a Falcon to run as a voice mail machine. There is no reason we couldn't
rig up an 8 bit A/D converter to the phone line, along with ring
indicator circuitry, and store digitized phone messages on your hard drive.

>from my smart house - I suppose you could sum it up as On-Screen Programming
>for the House. ;-)

Say! I've been doing part of this recently. I have completed an
infrared tranceiver, I call it an "IR gateway" for my Atari. It plugs
into a joystick port, costs about $10, and can send/receive IR remote
signals. Right now I'm developing reliable machine code to correctly
read most major brands of remote, which has involved learning about IR
protocols. One can simply digitize input from a remote, and send it
back out, but then each function requires a few hundred bytes of
storage. There's only about 4 bytes of info in each keypress, which
you can easily extract by looking at an oscilloscope trace, or
digitized signal on the ol' Atari screen. Just a few more wrinkles
to work out in the ML routine that does the same thing.

By the way, I found that the "Xanadu Zapper" circuit, which was
posted in sci.electronics a while ago, is not the most efficient for
using a 555 chip to generate 40kHz modulated IR signals. A few minor
changes produce more output power at 40kHz, leading to longer range.

If enough folks are interested maybe I'll write an AC article...?

2367. Modem interface question

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-10 03:09:44 UTC
From: winters@access.digex.net
Message-ID: <21lbto$cp7@access.digex.net>
Source record: 106129

Someone previously talked about "cheap 8 bitters". Well, this question
is probably not very practical from a cost point of view, but I thought it
was kind of neat to think about: I just purchased a Supra Atari Modem from
Toad computers for $19, really just to get my hands on a connector that
daisy chains on a disk drive to my Atari 800. Also, an RS-232 connector
comes out of one of the cables. I'm sure some of you have seen this kind
of Kludge connector before. Now, the vendor name of this gizmo has been
rubbed off and Toad Computers has no idea who makes it. The problem is
that the TELETALK (REV: AMODEM 7.2) program chokes when I try to use the
modem with a boot error - "Must have 850 Interface Module" before running
this communications software. I paid only $19 to eliminate having to buy
a "Real" RS-232 850 or a third party product. Supra has no idea what
software will work with this Kludge and before I shell out more money, I
was thinking - "Why not try to program something through a Joystick port
or build some kind of gizmo, myself?" I have the Tech Reference notes and
notice on pg. 146, the serial bus connector is described in detail.
Is there an 850 hardware manual, including schematics available? I
realize that this kind of stuff might involve a "little" programming
to convert ascii data to a format that can be sent or received by the
modem. Also, there is timing considerations..... I suppose that
is what the 850 handles! ;-)
Thanks for any hints on how to handle this stuff!

(hoping Cyberden isnt still out of disk space)

My friend (reachable at my address, just change PhBill to Mettelus) made
a program in C on his IBM and was going on about how cool it was. I was
interested (it is a polygon generator... nothing fancy, it just is drawn
in such a way that it looks pretty nifty). I asked him about the
program, and he explained it something like this:

four lines connected together
each point (corner) has a line that goes 20 pixels down
those lines are all connected (so it makes the polygon "thick")

well, I worked on this little ditty in TurboBASIC XL and added some
features that I dont think he has (yet):
true depth (the "20 pixels down" is actually determined (if you
want it to be) by how far down the screen the point
is.. if it's all the way to the bottom, then it's
20 pixels... if it's in the middle, it's 10, and if
it's at the top it's 0)
options! - you select "20 pixels" or 10 or 50 or whatever
you select if you want the "depth" mode on
you select how many points
you select the resolution (gr.7, 8, 15) (gr.7 is
the fastest)

anyways.. see next post (if I'm lucky) for ActioN! source! :)

>DLI to change $D01B to $40, and back to 0 in the middle of the screen.
>You'll have a psuedo mode $0E on the right half!

It isn't so much a "pseudo mode $0E," as a bona-fide "GTIA mode 9" (if you're really hitting bit 6, $40; to get "multi-colored graphics" you've got to be hitting bit 7 also/instead). The mode itself is quite familiar to XL/XE BASIC programmers who've got GRAPHICS 9 through GRAPHICS 15 built in (we old-timers had GRAPHICS 0 through 8, only; what you young whippersnappers call GRAPHICS 15, I had to build BY HAND from a GRAPHICS 8 display list! Uphill both ways!), and Antic even ran an article around the 1987 (give or take) time frame, describing and giving example programs for precisely the DLI-based mid-scanline GTIA-mode-switching trick you describe. As I recall, you had to carefully waste a precise amount of time in the DLI to control the horizontal position of the mode change.

I figure, either you WROTE that Antic article :-), or discovered the same hack INDEPENDENTLY. Either way, it's more than I have ever done and I am suitably impressed!

John Harris boggles my mind with a description of his custom tools, and
I'm sitting here going Holy $#!+ and trying to keep my head from explod-
ing at the sheer Wonder Of It All... :-)

> [... describes modification of "Synapse's internal PMG editor and
> character set editor" and "screen design utility"...]

That sounds cool! Who has rights to it, if anybody? Can it be distrib-
uted?

>I don't like Mac/65 because of the poor editor and bug/65. I still haven't
>seen the cart version, but I understand the editor hasn't been improved,
>and that's the tool I use most in a development system.

You're just spoiled because you can create these things for yourself --
it would KILL me to try to write an editor! :-)

I can comment a little on the cart version of MAC/65. First off, let me
say that, having used the disk-based version in the past, and BUG/65, I
find little or no changes in MAC/65, but vastly PREFER BUG/65 over its
replacement in the cart, "DDT" (short for Dunion's Debugging Tool, port-
ed from somewhere else where it was called something else). I like be-
ing able to pop INSTANTLY into MAC/65, rather than having to wait for
it to load from disk, particularly under various forms of SpartaDOS as
I can do the SAME quick change in and out of built-in BASIC on my XL.
It's pretty nice having BASIC, MAC/65, and for what it's worth DDT,
all available "at a moment's notice!" And with SpartaDOS X, even the
DOS is instantaneous. Nice. (Although I HAVE caught SDX in the act
of corrupting an AtariDOS disk in the last week, and it frequently
fails to recognize certain disks as either AtariDOS or SpartaDOS, for
reasons as yet unknown to me. I'm currently in the process of picking
SDX apart; that's a separate article... But I digress.) I don't really
miss full-screen editing in MAC/65 -- or at least I DIDN'T until you
mentioned it, John! :-) DDT even has its merits: it saves and restores
display/graphics context so that you can actually pop back and forth
between the DDT display and whatever the code-being-debugged has set
up, and it intercepts CONTROL+ESCAPE as a "hotkey" that will put you
back into DDT if your code-being-debugged locks up. This works most
of the time, but I find that I spend a lot of effort trying to work
around what DDT, SDX, et al have wedged into the system, in most of
the hacks I perpetrate: can't count on standard OS interrupt handlers
being where you expect 'em, etc. etc... TOO MANY HOOKS! There's
also no facility for depositing ATASCII or decimal bytes into memory
-- the explicit assumption is that "since MAC/65 and DDT are so well
integrated," you'll just stuff a few lines of extra code into your
MAC/65 source, and assemble that, to do such things -- nor for

SEARCHING the contents of memory for a string, byte-sequence, etc.
-- something I do a lot of and really used heavily in BUG/65. Not
to mention the weird things that happen when you've got all these
bank-switching carts, RAM, ROM, etc. etc. in and amongst the OS and
BASIC and SDX... It's rough developing under these conditions!

>I had already started my own project, which began life as MAE from Eastern
>House, and decided to continue with it. I've added lots of features, and
>made the existing ones easier to use. The assembler and debugger are
>integrated, so that I can use the symbol table and single line assembly in
>the debugger.

Sounds a lot more useful than MAC/65+DDT, that's for sure.

>I assemble my software directly into a RAM
>based version of my bank select cartridge, so having the assembler
>elsewhere is a must.

Must be nice having your own RAM-based bank-select cartridge! Tell us
more about this; what does it do, precisely? Is it essentially similar
to any of the existing "popular/commercial" RAM upgrades which I presume
use banking to get around the 6502's 64K address-space limitation?

>I just finished upgrading it to full 65816 capability, and am in the
>process of finishing a new editor that will work with the XEP80. It's full
>screen oriented, and has some neat stuff. Like pressing a key will look at
>the operand of the current line and take you to the location where the label
>is defined. It also sets a bookmark where you came from, so you can return
>with another key. Like an editor's version of JSR & RTS. Plus a
>multi-line undo, single key line duplicate, and other things I can't
>remember. Let me know if anyone wants to beta test this editor a bit.

Do these features exist ONLY in the "65816" version? Can it be put into
"6502 only" mode? (One thing that bugs me about MAC/65 is that it supports
instructions and addressing modes added in the 65C02 and not available
on the "stock" Atari. Every now and then I accidentally use one of these,
and it assembles just fine, but of course it won't RUN; I'd prefer to
have the option of telling MAC/65 to flag non-6502-standard syntax as an
error, and wondered if you've done that sort of thing in your assembler.

Are YOU using a 65816? In your Atari? Is ANYBODY?

All in all it sounds like your Atari is a piece of the twenty-first
century; I for one wish I could run right over and see it. :-) I don't
know whether I'd be an adequate beta tester for your editor or not; what
sorts of things would a beta tester be called upon to do?

Message-ID: <85149@cup.portal.com>
Source record: 106135

Definitely write an article! $10 to build, and I can think of four applications for it already!

- centralized control of VCR, stereo, CD player, etc. etc., tied to a control panel interface implemented in software to run as a "recording studio." I make lots of tapes to listen to in the car...

- timed control of stereo etc. to provide timer functions not present on my stereo.

- "translating" commands from one remote to another; some of my remotes have buttons that "don't do anything" because e.g. I haven't bought a single manufacturer's entire product line. I could intercept those buttons (if your IR interface can RECEIVE as well as SEND, that is) and reissue them as commands that "do something useful."

- tie any ol' random remote into any ol' computer-controllable function. My Mom's no-longer-living VCR's old remote could become my new Atari computer remote control...

And these are just off the top of my head; I'm sure I could think of lots more. Just did: tie the garage door opener into the whole shebang...

>is what the 850 handles! ;-)

The 850 converts Atari SIO bus signals to RS232, among other things.
There is an Atari 850 Interface Module Technical Manual which contains
850 programming information and a schematic; the copy I have has a part
number of "C017652 Rev B" printed on the back cover.

Date: 1993-07-10 11:59:45 UTC
From: ai792@cleveland.Freenet.Edu
Message-ID: <21mavh$he6@usenet.INS.CWRU.Edu>
Source record: 106137

I am in search of a decent text editor that is capable of handling rather large sections of code. Are there any out there that can handle code sections of nearly 42k++ ? I have a standard 130xe.

I have tried TextPro 5.0x from the archive, but cant figure out how to get the entire code to load in, however I can load in 3 sections of 16k using the Bank system.

-BRiT
ai792@po.cwru.edu

You can get the 850 manual from American Technavision for $12.50
+ $5.00 ship. You might want to get their catalog in case you
want to order other stuff because $5. is ship regardless of how
much you order. I have an 850 manual and it is pretty detailed.
Whether it has what you need, I don't know. It seems to me
someone would have to be very familiar with the RS-232 protocol
and the ATARI in order to write a handler to make the joystick
port into a RS-232. The MPP modem used it, but it may be that
in practical reality, the joystick port would not support higher
than 300 baud speeds.

>[...]

I say go for it. The more good traffic in comp.sys.atari.8bit/Info-Atari8,
the better. Care would have to be taken that it is done "right," because
this group is distributed to thousands of Usenet and Internet sites
throughout the world, which would not appreciate a sudden large garbage
factor here. Also, many readers of this group must pay by the line, so we
could lose them if the quantity of traffic was greatly increased while the
overall quality was greatly decreased.

>
>What is Wedge 2.1? What does it do and where does one go to
>acquire it?
>

Wedge is a great little utility that adds something like 20 additional commands (4 or 5 more if you have an MIO) to SpartaDos 3.2d. One thing SD32d does not support is a path statment, using the Wedge Desk Accessory, you and define the location of all your batch files and call them from any where in your system.

Some of the commands Wedge adds are:
Format - much better than xinit and very similar to the SDX format command
read - a lot like vtex 1.2 or the type command in SDX
edit - Small text editor (use for making you batch files, etc).
view - look inside .arc files w/o having to load superarc/unarc.
rendir - rename dir's, as good as rendir found on the SD Tools disk.
cold - warmboot
move - move file from one dir to another by updating the dir (great for when you are low on disk space)
find - search for files

And many others...When I lost my SDX for two weeks, having Wedge really made life easy again (got used to the SDX). You can find Wedge 2.1 at the archive at atari.archive.umich.edu under /atari/8bit as wedge.arc. Yes wedge takes up a small bit of memory but it's worth it.

Yeah, I had an old style satellite system with different boxes for the receiver and positioner. I taught the Atari to talk to both of them, so that I could punch up a channel, and it would send the appropriate signals to each box.

One of the products I did is an on screen TV guide using the Atari. It would have been very easy to select one of the on screen programs, and play the IR codes to take you to that channel. Or even play the codes to get your VCR to record the show at the proper time! I never actually did this though.

>for precisely the DLI-based mid-scanline GTIA-mode-switching trick you
>describe. As I recall, you had to carefully waste a precise amount of
>time in the DLI to control the horizontal position of the mode change.

Except that this mode has 160 horizontal resolution and only 4 colors.
Perhaps you didn't understand that it's *after* returning the GTIA register
back to 0 that the mode appears. Either that, or I don't understand your
post.

>I figure, either you WROTE that Antic article :-), or discovered the
>same hack INDEPENDENTLY. Either way, it's more than I have ever done and
>I am suitably impressed!

Actually, I haven't seen it. I thought I had taken that magazine through
to its demise, but I might have let it lapse somewhere before. But if they
don't try to make *two* GTIA mode changes on the line, they won't have
found this mode $F to $E switch.

>I for one have never heard of the "Hyper E: screen speedup program." Is
>it part of some larger package?

I'll upload it here. It can speed up text drawing by 200%. It makes a
huge difference in the editor I wrote.

>
>That sounds cool! Who has rights to it, if anybody? Can it be distrib-
>uted?

Can anybody answer this question for me? They were both in house development tools that they never sold to the general public. The PMG editor has 'Synapse Confidential' plastered on the main screen. Realistically, I can't imagine anyone minding this thing getting posted, since no one will lose, or has ever made any money on the product.

Can anybody help with the morals on this one? Mike? :-)

>Description of Mac/65 cart.

Thanks for the description. If you like BUG/65, you should enjoy the current debugger I have.

>Must be nice having your own RAM-based bank-select cartridge! Tell us
>more about this; what does it do, precisely? Is it essentially similar
>to any of the existing "popular/commercial" RAM upgrades which I presume
>use banking to get around the 6502's 64K address-space limitation?

It's similar, but it bank selects in the cartridge address space, and is just a RAM version of what I ultimately burn ROMs for. It uses $D5xx addresses just like the SDX cart to do bank select. There's a psuedo op in the assembler to put out the bank select codes, so that I can for example assemble a bunch of stuff into the cart, switch banks, and assemble a bunch more stuff into the same place -- it will be stored in a different bank.

>Do these features exist ONLY in the "65816" version? Can it be put into
>"6502 only" mode? (One thing that bugs me about MAC/65 is that it supports

>and it assembles just fine, but of course it won't RUN; I'd prefer to
>have the option of telling MAC/65 to flag non-6502-standard syntax as an
>error, and wondered if you've done that sort of thing in your assembler.

All of the features are currently available for a standard 6502. But I don't have any '6502 only' mode in the assembler that would flag non-6502 stuff. Sorry, this will do just what MAC does.

I probably will make a 65816 dependant version, to speed things up, but I'll try to do this in macros so that I can still create 6502 versions.

>Are YOU using a 65816? In your Atari? Is ANYBODY?

Soon. No. Yes.

>All in all it sounds like your Atari is a piece of the twenty-first
>century; I for one wish I could run right over and see it. :-) I don't
>know whether I'd be an adequate beta tester for your editor or not; what
>sorts of things would a beta tester be called upon to do?

The main duty of a beta tester, is not to flame the author if my 'unfinished' program trashes a priceless piece of work. :-) Seriously, this program as I upload it has less than two weeks worth of programming time -- and even less testing. It *will* have bugs. It may munch something that you're working on, even though it hasn't been designed specifically for that purpose. :-) Ideally, beta testing helps the author find these bugs, because different people do things in different ways. It will be a big help to me to find and eliminate these as fast as possible. For the testers, it gives them an opportunity to preview a product, and perhaps influence its final design. I will consider all suggestions.

These are some basic instructions for the new editor.

First, a few limitations:

Currently, this editor will not allow lines longer than the right margin.
It will allow 80 column lines with the XEP80 device though.

The editor saves files in straight ATASCII, which means the file size will
be very wasteful with TABed text. Normally, I wouldn't think about doing
something like this, but it made the editor the simplest and fastest it
could be. I will most likely put in an encoding scheme where the ATASCII
values from $01-$1F refer to a packed number of spaces. This is the method
I use in the current editor integrated into MAE. It will sadly slow down
screen scrolling and find&replace, so I'll probably make this packing
optional.

Okay, on to the good stuff.

The editor has several configurable parameters that can be modified with a
sector/file editor. These are located at +3 bytes from the start address.
+9 counting the DOS binary header. Here they are: (Words are 6502 Lo,Hi)

Word - Text buffer start adr. If 0, the editor will use MEMLO.
Word - Text buffer end. If 0, the editor will use MEMTOP.
Byte - 0=Replace mode, 1=Insert mode
3 By - Three bytes for the Tab column settings for asm fields.
Byte - When drawing the screen for a particular location, such as a Find or
Goto command, this byte sets the screen row where the desired line
will be drawn. If you set this to 0, the line will be on the top row.
$0C will put the line in the middle of the screen. Default is 8.
Byte - # of lines the PgUp & PgDn commands will move by. Setting this to 24
gives single screen paging. If you normally use the scrolling for
short moves anyway, you can set this value to something like 100 to
jump through the file by larger steps.
Byte - Line length saved in the Undo buffers. I defaulted this to 32 chars,
which gets all the code region and at least part of the comment field.
If you want to save the entire line, set this byte equal to RMARGN.
Byte - # of Undo buffers. This number controls how many lines of history
can be Undo'ed. Multiplied by the byte above, equals the total size
needed for the Undo storage.
String - Default drive and dir spec. This must be in the form "Dn:?????".
This should likely be something like "D3:*.*", or "D3:*.SRC" if you
want dir listings to only show a certain file type.
Filenames for loading and saving do not require a full "Dn:" filespec.
If you type just a name, it will be prepended with the default drive
selected here.

The editor begins in the ESC menu. During the session, the ESC key will bring this menu back.

When returning from the Esc menu, the screen will be redrawn placing the current text line in the screen position specified with the configure byte +8 above. This makes pressing Esc twice a convenient way to re-center the screen around the current line you're working with.

Esc Menu Commands:

A - Assemble. Not implemented
D - DOS
L - Load file. You do not need to type an entire filespec. The default drive 'Dn:' will be prepended if the entered name doesn't have a ':'
M - Monitor. Not implemented.
S - Save File. Press Shift-S to save cut block. Save displays the last loaded filename. Press Return to accept it, or backspace and change. As long as the editor is using ATASCII, you can save to P: to print.
1-9 Directory, and set default drive. When given the default directory spec, you may press Esc to cancel the listing, but the default drive change will still be in place. This allows you to make a quick drive change without waiting for the directory to display.
Shift-Clear - Clear text buffer.

Editing Commands:

Standard Atari editing keys apply.

Return will insert a new line if pressed at the end of the current line. Otherwise, it will just move to the line below.

S^Up (Shift&Ctl&Up) Scroll up.
S^Dn Scroll Down. These two commands are handy, because they scroll Immediately without waiting for the cursor to reach the screen's edge.
S^< Page up by configurable # of lines
S^> Page Down
^, Start of line
^. End of line
^T Top of file
^B Bottom of file

^F - Find (Case sensitive for now)
^R - Replace
^N - Find Next
^P - Find Previous
^G - Goto line number. You can also enter a '+' or '-' as the first character to move a number of lines relative to the current location.
^L - Enter a label name, and the editor will jump to where the label is defined. (By searching from the first column only.)
^S - Set bookmark at current location.
^M - Jump to bookmark.
^J - The editor's version of a JSR. It looks at the operand field of the current line, and jumps to where that label is defined. It also sets a bookmark at the current line so that you can return with a ^M.

^I - Toggle Insert/Replace mode.

^Z - Set block start
^X - Cut from block start to current line. (Forwards only -- sorry)
^C - Copy from block start to current.
^V - Paste cut buffer at current.
^D - Duplicate line

^U - Undo line deletes, or changed lines. Does not undo block operations.

From what I've heard (I could be wrong - no flames please) the
current generation of flash-cards degrade over time. The current lifetime
is about a 100,000 writes per ram sector or thereabouts.

A few more notes:

The editor is set to load at $9000-$9AFF, so it will fit under the screen memory of an installed cart. I realized I didn't append a run address to the file, so DOS 2 derivative users will have to run it manually.

The editor will warmstart without losing its file if you return to DOS and run at $9000 again.

One other advantage of having Hyper E: burned into the OS ROM, is that it speeds up programs that go through the $E400 vectors, whereas the ram loaded version will only speed up programs that go through CIO.

John,

Most TV guies now have those VCR+ codes for newer VCRs. If you have a
VCR that doesn't automatically support this (only the newer ones do),
it would be cool to see the 8 bit support this feature in your above hack.

: Several of my projects, we provide the hardware to the customers for free,
: and charge a monthly fee for programming. Having an inexpensive machine is
: a great benefit in these cases.

: I really thought hard about switching to the Amiga. I have one, and like
: it as a general computer. I'll probably stay where I am though as long as
: I can.

: I have lost very few sales due to inferior video quality. In fact, I have
: come up with my own defination of 'broadcast quality' as I have found it in
: the field. It means, "Whatever the engineer is willing to hook into his
: system." It is been an incredible thrill to see some of the hardware I
: have replaced with an Atari. At Oceanic Cable in Honolulu, (a very major
: system), they had a $40,000 PC based system with SVGA, multiple video
: cameras, and all kinds of stuff. No one could figure out how to use it.
: It's now sitting idle, and my Atari program is putting up more interesting
: stuff than they've ever had on that other system!

Please tell us more about what EXACTLY you are doing with the Atari and
video. I love my 8-bit, but I honestly can't see Atari and broadcast
quality in the same sentence. (your above statement non-withstanding).
I am working now with the AMiga and the Video Toaster- and if you are
familiar with it (especially the new Video Toaster 4000) there is a big
difference between what its doing and an 8bit.

I would like to hear how you specifically can use the 8bit in this
type of enviroment. Maybe I can get a few ideas.

Both Atariwriter+ and PaperClip easily support the banked RAM in the 130XE (and expanded XLs). PaperClip does it transparently, but IMO Atariwriter+ does a better job of handling the extra banks than TextPro.
Using PaperClip on my 256K Rambo 1200XL I have 112K of free RAM available for text. I don't know how much it would be with a 128K computer.

Thanks Jeff, I'll pass all that on. Ansiterm is an Ansi terminal programme for the 8-bit, unfortunately the copy I/we have only does 1200 baud and the Ansi bbs that we want access to doesn't accept anything under 2400. It's one of those boards where you can't turn the Ansi characters off hence extremely hard to read!

CD>There was a set of articles in Analog Magazine a few years back that
CD>showed how to turn one of those BSR Home Controller thingies from
CD>Radio Shack into a device that you can run from your 8 bit. That
CD>way, those plug in light, wall outlet, and other modules could be controlled
CD>by software. Man, combine that with the Covox VoiceMaster Junior that
CD>was out years ago, that did voice recognition, and you have your very
CD>own HAL 9000 running your home!

Actually, Covox has already marketed the above setup for use with an
Atari or Commodore 64 and BSR modules. It used a key word to "wake up"
the system, followed by a limited set of commands which caused the
computer to reprogram the controller.

I don't know if Covox still has any of this available though.

I'm looking for info on using the Xformer 8-bit emulator for the ST.
I don't have an 850 interface for my 8bit, but I do have the xformer cable to hook up my ST to an Indus GT drive. My question is, how do I transfer files from my ST to the 8-bit. I plan on downloading 8-bit files using the ST, and somehow getting the converted over to an 8-bit disc. I have tried to use UTIL on my 486 to transfer files to Double Density Mydos discs (this would be the ideal answer because I wouldn't have to drag my Indus over to my ST each time I want to download an 8bit file.) I tried also using Bobterm that came with the Xformer, but that was limited to 1200 baud transfers, that not taking advantage of the 9600 baud modem that I log onto the schools computer.
I pose many questions here, there has to be a simple way to do this using one of the methods mentioned with additional tweaking. Any help will get a UUEJNCODED GIF of my teddy bear (just kidding).

Of course there's a big difference. What I'm referring to when I made the 'broadcast quality' statement, is that the real world installations we have done, including some large TCI and other systems, haven't demanded specific video specs. They are willing to broadcast an Atari 8 bit signal, not because they can't tell the difference, but because it's 'good enough'.

The degradation of composite, and the fact that signals are being passed through miles of cable and ultimately received by RF in most cases, actually works to our advantage. It tends to hide and blur the resolution a bit, so that the jaggies are not as pronounced. Much like the first 'soft focus' Amiga monitors, you can look at it as a sort of hardware anti-aliasing. :-) It's all how you choose to see things. Finally, add the fact that these screens are being viewed from a couch 10 feet away, and very transitory, no one is studying them up close. I think that's what our customers realize, when they decide that the 8 bit video is 'good enough'.

As for what I do, most of the products are character generators, or related products. They use the 320x200 resolution, and lots of DLI color changes. All of the fonts were hand drawn by me, and very optimized. The CG is extremely easy to use, with on-line context sensitive help. In fact, we originally shipped these without a manual, just to show how much faith we had that anyone could walk right up and use the thing. The whole system is completely remote programmable. Anything you can do from the keyboard, you can do from another location. There are many other ease of use features that set us apart from competing products, and ultimately generate sales.

A great example of what I'm talking about is an on screen TV guide service that we download to Atari 8 bits. The screen presentation is much, much, better than the Prevue Guide that uses an Amiga. The scrolling Prevue Guide is a nuisance to read. And it takes much too long to cycle through all of the listings. Our format is much more readable, and we can run through the entire cycle of programming in less than 3 minutes. This means users can scan for 'what's on next' within the time break between programs. Every system where Prevue Guide was replaced by our service, (called Pro/Guide), the user response has been excellent, and the channel is used

much more often.

One last thing. The function of a CG is to get messages across to your audience. Well designed messages, fonts, and color choices will still get the information across. Even without chrome letters and drop shadow.

First of all, the current version of Bobterm will run at 19.2K. I use it
here with a v.32bis.

If you still need to go the XFormer route, there is a program for the
XFormer to do file transfers. I think it's called QTU. It transfers both
individual files, or ST virtual disks onto 8 bit drives.

Two things...

I've been in more than a few hotels with an 'information' channel, and it's easy to tell the 8-bit.. Kinda gives you a warm feeling.

Also, Prevue Guide is better than it used to be (lists the next 1 1/2 hour block) but the font is so large you can't read the title.... And I once saw it crash for a few hours ("Guru Mediation Error, press left mouse button.", don't they isolate these things?)

Recently, I found a few hours and sat down to finish transferring
my old 8bit disks to disk images under SIO2PC. Every so often
I'd come across a disk with the tell tale "blip-- blip-- blip---"...
one of these was my boot disk of Koronis Rift. I'm not sure whether
they are copy protection bad sectors, or if the disk is just bad.
The game won't boot directly from the floppy anymore, so it seems
to be the disk...

Has anyone been able to get this game running using SIO2PC?

The power supply of the 800Xl provides +5 volts only. This voltage is then run through 3 different choke coils to provide voltage to various parts of the computer. If you are getting a light, your incomming voltage is probably OK.

Atari was notorius for using cheap IC sockets and PCB boards. Just for grins I'd suggest opening up your system and reseating any socketed chips. If it still doesn't work, then you should look at getting it repaired. If your willing to wait a while, I might be able to try and fix it for you.

A long time ago is not sufficient for me to not know you. I got my 8-bit in 1984 and have some software from considerably before that. Being an olde fart, I can't remember last week, but a long time ago is no problem.

Has anyone posted a list of John Harris games for us uninitiated? I have piles of games that my two sons have done their best to wear out, so I probably have some of John's, but since I don't play 'em, I'm not familiar with the names involved. Names I would recognize are the authors of Express!, SynCalc, or TextPro, although I couldn't tell you who wrote my most-used 8-bit SW, AtariWriter.

Now that I think of it, there was ONE game I have enjoyed on the 8-bit, and I was even fool enough to buy multiple copies: BallBlazer. Does anyone know who wrote that for LucasFilm? Great fun, even if either of my sons can beat me.

2414. Anyone know what the PILL is?

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-12 19:01:30 UTC
From: fireman@garfield.catt.ncsu.edu
Message-ID: <fireman.742503690@news.ncsu.edu>
Source record: 106073

Hello folks,

I recently acquired and ATARI 810 hard drive for my old Atari
800 computer. All I used to have was a 410 cassette drive to store
programs. Let me tell you that the 810 is much faster :). I wished I
had it 10 years or so ago.

Anyway I have a problem. When I got the disk drive I got
several disks with a label that says "pill games" on them. Does anyone
know what this "pill" is? I assume it's some sort of copying utility
that would allow you to make illegal copies of disks or maybe even
cartidges. When I boot a disk labeled "pill games" I get a menu with
several different games on them. Whan I choose one of these games, the
disk drive spins for a second, then I get a message "Turn on Pill then
hit return" (or something close). If I hit return the drive spins a few
seconds then I get the original menu again :(

This 810 has had a little switch installed on the front of the
drive which I do not know what it does. Could this be the pill switch?
I also remember hearing something about a "happy" enchancement, does
anyone know what this is?

Thanks a bunch for any help. After buying the 810 I have
acquired a new love for my Atari computer. For mid 80's technology,
it's not to bad. Not bad at all.

Thanks a bunch,

Tracy B.

John Harris was one of the most amazing hackers I ever heard of, according to
what I read in "Hackers". John - it is cool to actually hear from you, after
reading about you several years ago! Please keep sending lots of messages
to this newsgroup about your experiences with Atari. I got a few questions
for you, John: Did you ever program yourself a graphics/sound "simulator"
to enable yourself to prototype game ideas on the fly? What do you think
of Forth, as compared to 6502? What do you think of C64 (Ha Ha!!)? I got
a C64 sitting in a box (a friend of mine left it here 2 years ago....)
and I'll tell everyone one thing - I used to work at a place using them
and I broke off a couple of the disk drive handles somehow - maybe all that
"rugged" C64 plastic construction? :-) I have beat my Atari equipment all
to hell, dropping it on the floor etc... and it keeps on tickin'!!!

Scott,

The Logo screen is only available on the 1200XL.

You get to it the same way to you get to the self test screen on the
600Xl and 800Xl.

Well USENET readers, I'm going to be disappearing from the Internet
for a while. I'm moving some 440 miles back to my hometown of Alpena,
Michigan for a while, after which I may abandon my pursuit if a
BS degree in Electrical Engineering, and instead go for a Computer Science
degree. The degree is more profession related rather than symbolyzing
my abandonment for one field or the other. I plan on becoming, and remaining
adept in both fields. I already do just as much programming on the 8 bit
as I do hardware hacks. They go hand in hand these days.

My move back to Alpena is going to be rather Chaotic, and I'm not sure how
long it will be before I reappear on the Internet. It may only be
several weeks, or as long as a couple months. When I do reappear, it'll
probably be via my Freenet account. ANYTHING is long distance from Alpena,
including SPRINTNET and TYMNET nodes! Using a service like Delphi, CIS,
or GEnie would only increase my cost of accessing the Internet.
The Cleveland Freenet is long distance for me, like all the others, but
at least it doesn't have any other access fees. I'll miss the luxuries
of a UNIX account, FTP, Telnet, and all the other goodies that go with it,
but I'll survive.

I will continue as columnist in Atari Classics Magazine. The Moonlight
Workshop will be moving with me.

If any one wishes to reach me by postal mail, the following will be
my address as of July 22, 1993.

Jeff McWilliams - Moonlight Workshop
481 Pine Meadow Lane, Apt #6
Alpena, MI 49707

I'll do my best to promptly answer any/all letters that come my way. Things
have been REALLY hectic around here for the past month or so, and I KNOW
I have at least a few letters that I've still left unanswered. I'll get
to them once I'm settled in again, and things resume some sense of normalcy.

For you XEP80 Atariwriter 80 users out there, be looking for the
Auxiliary Menu on the next program disk. IT'll greatly improve the usability
of AW80 with Sparta and MYDOS users. Already Ben the wondrous editor
has come up with comments and complaints. I've learned the hard way that
such programs should be thoroughly beta tested BEFORE I send them to
Ben. If there's a bug to be found, Ben's the guy to find it, that's for sure.
An updated version is already in the works, which will be DOS smart,
and have more features. If you get the program and have any
questions, comments, suggestions, feel free to send them to my new mail address.

My regular series on Expanded RAM continues. I've got a pretty complete list of program that use XE memory, and this list will be covered in detail in the October issue. Once that's done, who knows? Maybe I'll actually publish something with hardware involved!

Well, I'm signing off. The 1200XLD is being carefully placed in its shipping box, along with various peripherals and diskettes and stuff. As the lid closes, I bit you all farewell until I return....

Jeff "Moonlight Workshop" Atari Classics magazine

John D Harris (jharris@cup.portal.com) wrote:
: done, including some large TCI and other systems, haven't demanded specific
: video specs. They are willing to broadcast an Atari 8 bit signal, not
: because they can't tell the difference, but because it's 'good enough'.

I have seen some such system on the Cable system here in Montgomery County, Maryland- right outside D.C. One of the channels (I can't recall the exact one) displays some sort of 'Public Message Screens" I can tell (from years of experience) those Atari graphics modes- but they are just straight modes- nothing outside of stock that I can see. They just flash these messages up in between programs. Is this what your doing?

: through the entire cycle of programming in less than 3 minutes. This means
: users can scan for 'what's on next' within the time break between programs.

Are the people at home just watching the CG scrolling along?

: One last thing. The function of a CG is to get messages across to your
: audience. Well designed messages, fonts, and color choices will still get
: the information across. Even without chrome letters and drop shadow.

True- and somebody must appreciate the $100's of dollars for the Atari setup as compared to around $4000 for the Amiga & Toaster.......

2421. Re: Looking for a game

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-13 02:11:48 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <85350@cup.portal.com>
Source record: 106081

Dan B. wrote me e-mail saying that my posting of Tricky Tracks sounded like the game he was interested in. I "inherited" a copy of TT on a disk that came with part of a used Atari system I bought a couple of years ago, and so was able to load it up and see the following message at the beginning:

"Dave & Robin Oblad present Tricky Tracks, compliments of Atari Sig and Antic Magazine"

To me this suggests that the program may originally have appeared as a type-in or Disk Bonus offering in Antic Magazine, and that the program is therefore now in the public domain and can be freely distributed (I have a printout from this very newsgroup from a year or so ago, in which it was asserted that Antic and Analog have relinquished rights to the programs published therein) -- but does anyone out there know FOR SURE?

I'd like to know where ownership of TT stands, before I gallivant off into the unknown regions of sending Dan B. a copy of it...

I don't know what kind of distribution they got back then. This was from
1981-82. The titles I did for On-Line Systems, were Jawbreaker,
Mousekattack, and Frogger. The Parker Brothers Frogger cartridge is from
my code as well.

I still have some Atari stuff left for sale:

800 computer with 256k AXLON compatable ram card (Computer works great!)
800xl computer, standard, no modifications, also works great. (includes box)
810 disk drive, original no modifications.
30 brand new unopened floppies (could throw in free with drive)

Carts:
Telelink I
Video Easel
Atari Writer
Star Raiders
Atari Basic

Software: All in orignal boxes with manuals (3-ring binders).
VisiCalc (Spreadsheet)
SynCalc (Spreadsheet)
SynFile (Database)

Yes, it's called QTU. It's not the world's friendliest program, but it
does work once you figure it out. I use it frequently to transfer text
and AtariWriter files between my two systems (XL & ST).

The pill was a cart with a switch and a resistor that pulled the line
high that tells the atari that a cart is present. This is necessary
for some games that had code to tell whether they were being run from
a cart or not. From my ill-spent youth I recall that cracked versions
of everything I ever saw my friend with a pill copy for himself were
eventually available. The advantage was that you could borrow carts
from friends and make your own copies without having to crack the relatively
simple protection on them yourself.

The switch is almost certainly one of two things:

-it may disable the write protect notch sensor to allow you to format
and write to the backs of disks without cutting a notch in the disk.
This is a very common disk drive mod.

-it may slow down the disk motor to allow the disk to write bad sectors,
which lets you copy disks that have been copy protected with bad sectors
if you have the appropriate software. Again, cracked versions of that
stuff were readily available back then too, so this would have been for
very casual copying of friends' originals. This is also thoroughly useless
for backing up anything more recent that about 1983.

At any rate, I don't condone piracy although like everyone else of my
generation I have a box full of games at home. I AM slowly but surely
replacing the stuff I actually still play with original copies, which is
probably too little too late :(. There is still a lot of great old (and
some new!) stuff available from mail order dealers VERY reasonably.
Check out the vendors list in the FAQ and support the remaining community!

To answer your question, the Atari logo screen only appeared on the
1200XL, not the rest of the XL/XE series. The logo screens and the
blackboard replaced the XL/XE self test. You can get to them the same
way that you get to the self test (ie type "bye" at prompt, etc.)

Hola mundo.

Many games' authors are unknown for us.

Only those from Activision has the names of the author in the finescrolling
bottom line, and also a picture of him/her in the catalogs.
(Who knows where in the world are those guys?)

Other names appears in a large/huge list of credits, and I found just one
name in two or more games (the author of the soundtrack, I guess).

It seems that 'important' distributors like to hide the name of the autor.

BTW, I'm still receiving the name, e-mail addresses and/or credits of the
readers of this newsgroup. If you wrote some well-known games/applications
(or a game you want to make public through this newsgroup), let me know...

Bye... ++V

OK, I stand corrected, the TurboBase manual is 700 pages, not 200. (Well, I knew it was pretty LONG, anyway!). I wasn't aware of the nasty copy protection scheme, tho. I think that was stupid. Like, the guy really thought people would pirate a program that required a 700-page manual?

I'd like to make a final point about the absudity of my switching over to an IBM to service AC subscriptions. Right now I have 3 8-bit systems set up in my house (well, four if you include the several motherboards I've got in pieces on the kitchen table. That Alchemist guy is always tinkering with the video, he's never satisfied...). A major reason my STe & 286 live in the closet is because I GOT NO SPACE TO SET THEM UP. I'm not about to take down one of my 8-bit systems to set up my 286 (damn 286 takes up twice as much space as an 800XL-based 8bit does).

In point of fact, it isn't that I'm a "purist". I'm an 8-Bitter. I *LIKE* my 8-bit machines better than any of the others that I have/use (this $5000 Mac IIci they give me here at work isn't bad, but I STILL prefer my trusty 800XL). It would simply never occur to me to abandon my 8bit & run to some totally different platform just to do one type of application. It's not my nature, I'm not made that way. If I see a flaw, I fix it, I don't just wimp out, throw up my hands & run away. I long ago decided where I want to be in the computer world. Atari 8-bits. Till Death do us part. (My ex-wife did not take that line as seriously as I do). Having made my commitment, my die is cast: I have dug my trenches & I will fight all my battles in this my chosen arena. I like to think everyone who reads AC feels this way, too. And what it comes down to is, if there is a bug in a program, hey people let's fix it! Let's make it BETTER. Even if it means- such as in the case of TurboFile- you have to negotiate the rights to the darn thing in order to fix the freakin' bug. If my endeavors are successful (& the vectors at present are pointed in that direction), I'll not only solve my own personal problem RE: the AC subscriber list, but ultimately make it possible for the product to be offered to the market again. Killing 2 birds with one stone & all that.

But, for me to just go running to some other computer to solve my problem would fly in the face of everything I'm doing. It would render meaningless my commitment to the 8bits & the work I put into the magazine. I recoil at the very notion of using anything other than an Atari 8-bit to produce a magazine devoted to Atari 8bits.

In point of fact TurboFile is serving the needs of AC extremely well, even in its flawed state. I now know how to recognize the bug when it appears, & avoid it. The danger is a possible loss of records if I'm tired or forget to give the proper response when the monster rears its head. Fortunately the conditions giving rise to the bug occur only rarely. At the moment I avoid trouble by keeping vigilant. I'd rate my satisfaction with the program at something like

95%, which is about as high as I rate anything involving computers. I love BobTerm & the BB/FB, but those things also are less than perfect. That doesn't mean I trash the works & run to some other computer. (It DOES mean I call up Bob Puff & give him a piece of my mind about how to make things BETTER. The neat thing about CSS is, they actually LISTEN. Next thing you know that Puff guy is upgrading his docs or sending new ROMs or whatever, & the world has just gotten a wee bit better.)

If the whole world would quit chasing rainbows & just clean up some little patch of existence they've staked out for themselves, the world would end up a better place.

I think they've done or are doing an update of Prevue Guide. There aren't GURU's in the Amiga OS anymore (2.x and up). Hopefully any cable co. that's using Prevue Guide will update the software and/or OS.

Now to get back on the Atari track. John, where can one get information on your software. I'm in the middle of a multimedia major at school and would like to get my Atari involved.

I finally decided to get a word processor for my 800xl. Which one is the best? AtariWriter? Any opinions or suggestions appreciated.

Thanks,
Scott

Ok... I wanna know HOW to <hange the modes... the first (and only!) time
I <ame a<ross this was when I saw the OUR5oft demo. I WANt THOSE
ISSUES OF ANTI@!!!!!!!!

Also... I'd like to see your multi-<olored <hara<ters.... Imagine a good looking 16 <olor 80 <olumn ANSI mode on the Atari's! :) THaT would be nifty. ;)

And re: Hyper E:, it's just a little (just over 1k) repla<ement handler for the OS E: driver. I've had problems with the one I use, so I dont use it too mu<h (1) some programs timing is handled partly by the amount of time s<reen display takes... 2) some programs don't work with it (at least I'm guessing some wouldn't..?) 3) it has a bug (the version I have) with ES@ape <odes.)

BtW- the OUR5OFT demo (OUR5OFT.AR@ or .@OM) is up on the ar<hives

GO GET IT!!

Not only does it do this 3-mode/line tri<k, but it also displays 24 player/missles on the s<reen (oops... 25 hehe 8 3-<olor'ds plus 1 single-<olored) ...

as well as a bun<h of other <ool "you supposedly <ant do this" <rap

again, to emphasize : I WANT THOSE ARTI@LES!!!

>John: Did you ever program yourself a graphics/sound "simulator"
>to enable yourself to prototype game ideas on the fly?

Not really. Although I did have a nice character graphics design tool that let me draw screens easily.

Sounds I always had a dreadful time with.

Does anyone remember/like the explosion sound in the On-Line game Threshold? I did that one, and thought it came out interesting.

>What do you think of Forth, as compared to 6502?

I think it's interesting. Which is more than I can say for C or any of the popular high level languages. None of the Forth implementations on the Atari could produce self-contained compiled code as I remember though. That pretty much wiped it out as far as software development. I never really did much with it except play around with its unique structure. I loved the interactive ability.

As far as the second part of that statement, "Nothing compares to assembly", IMHO. Every major piece of work I ever do will be in assembly, and I wish more people felt that way.

>What do you think of C64 (Ha Ha!!)?

I can't comment on the durability. I couldn't stand to use one long enough to find out. I appologize to any C64 lovers out there, but there's several reasons I loved and continued to use the Atari, and the C64 didn't have any of them. First and foremost, the OS. Then, a better full screen editor, better DOSes, graphics that I thought were more fun to program, and lots of flexibility in designing screen modes, and more of them. From the programming side of things, the nail in the 64's coffin for me was when I read the technical programming manuals that stated, "After writing to this register, you need to wait xx microseconds and write it again, just in case the first one didn't take." I suppose I should be more lenient, but I really thought that was seriously kludgy.

On the plus side, it did have nicer sound capability. It theoretically had nicer graphic ability on paper, but the poor quality of the video signal eliminated any of those potential advantages.

Ok, I'll give ACTION! Kermit a try, but what are it's requirements?

> problems that KERMIT-65 ("NR" edition) does. If I were to make an educated
> guess, the problem might be that KERMIT-65 is using very short packets,
> whereas the mainframe Kermit is using a much larger packet size and has to
> "self-adjust" downwards. KERMIT-65 has a packet size of 94. You might try
> adjusting the size of the data packet on the mainframe to match and see
> whether or not that might help.

Yes, I have also tried this as well, but still no luck. When I
first got the 2400 modem, adjusting the packet size on the site to 94 did
seem to help for a couple of transfers, but since then I haven't
been able to duplicate the results.

*SX212 to the rescue...which is definitely odd. Using the SX212
direct-connected with an R: handler works great, but when connected
through the P:R:Connection, has the same problems as the Zoom modem.

> |__o_______|_____________________________|_________________|

Well.... re: TextPro... sure, TextPro is GREAT, but AtariWriter+ is also
great. Here's my point ;) ... TextPro is a VERY good text pro<essor (I
use it ALWAYS with DDIII), and AtariWriter+ is a VERY good word pro<essor
(it does spell-<he<k, print-preview, et<...). I like them both about
the same. Here's the deal- if you <an get ahold of AtariWriter+ with
it's spell-<he<ker, then all you need to do is save your TextPro file to
an Atari 2.5 / @ompatible disk, then boot AW+, spell<he<k, resave, then
<opy the file from the Atari DOS disk ba<k to Sparta/MyDOS/whatever
(unless you have pat<hes or something for AW+, where the middle-man disk
would be obsolete) and print it (with AW+, PrintStar, DDIII, whatever)

My two points- textpro is great- still "supported" (!? ehhe)
very versitile
but also AtariWriter+ is great- very easy to use (I love blo<k
highlighting ;)), spell@he<ker,
et<... only problems is 12k
buffer size (w/o expanded memory)
the inability to jump ba<k to DOS,
and the Atari DOS 2.5 boot disk..

>of experience) those Atari graphics modes- but they are just straight modes-
>nothing outside of stock that I can see. They just flash these messages up
>in between programs. Is this what your doing?

This is the type of programs I'm doing, yes. Older programs I did for
other companies used the stock modes. It was done to their specifications,
and they were uninterested in doing anything more. It is possible that you
are seeing one of those early systems, although I am not the only one who
did programs like this.

Only my most recent system has hand drawn, proportionally spaced and
auto-kerned fonts done in the 320x200 mode. It is harder to recognize as
an Atari 8 bit, just because there isn't anything 'stock' looking on the
screens.

>: through the entire cycle of programming in less than 3 minutes. This means
>: users can scan for 'what's on next' within the time break between programs.
>
>Are the people at home just watching the CG scrolling along?

It doesn't scroll, but it does flip screens using a kind of venetian (sp?)
blind effect. And yes, the people just watch through those screens. It is
not like the interactive systems being pushed now, and I don't know what
those systems will do to our market. I personally feel our format is very
clean, and gets the information across very effeciently. It's also
dramatically less expensive, since the interactive systems need to have an
electronic device in every home to provide that extra control. That cost
factor should hopefully leave us with plenty of maarket potential.

Strangely, my partner feels the interactive system isn't going to work out
very well for the bulk of consumers. You know, the ones who don't know how
to program a VCR. He feels the technology is advancing beyond the
capabilities and interests of the masses. The way I look at it, since
major cable companies have a stock in these interactive guides, they're
going to get pushed in whether people want them or not.

Boy, I'll say! My old 800XL used to work intermittently, depending upon how the motherboard was flexed (i.e. if you flexed the MB or sometimes the entire case it would work). Finally got so non-intermittent that I found an 800 to replace it with (and just last week tossed the XL into the dumpster in preparation for my move).

I think the 400/800s were built better...

2455. AC Database (Used to be: Micromiser)

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-14 15:08:46 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9307141417.AA01038@smithkline.com>
Source record: 105961

As I work my way thru the email that accumulated while I was away working on the August AC, I continue to be astounded by the many pundits out there who are suddenly experts on how to operate magazine databases. I'm sure these posts are well-intentioned, but coming as they do from people who haven't the faintest idea what AC is all about I am doubly glad I have the self-confidence to proceed as I am & not to heed the "advice" of these self-styled pundits.

Richard Dell, for example, seems to know all sorts of details about the financial operations of AC, details I myself am reading here for the first time & which come as news to me.

For the record:

Subscriber money is NOT involved in my effort to secure rights to TurboFile; this is an assumption on Mr. Dell's part, & is patently false. The effort is a purely PRIVATE one involving several individuals & completely PRIVATE funding. Mr. mentions a sum of $2500 that was "being invested in this project". Where he got that figure I have no idea. News to ME. Obviously the product of an over-active imagination. I have never mentioned any sums of money nor do I intend to.

As the how "easy" it would be to find local IBM programmers who would set up the application on my 286, Mr. Dell fails to supply details. I'm sure my employer would just *LOVE* to have me spend several hours of paid time calling all around to evaluate the the services of the zillions of IBM programmers in my area. I spend 8 hours a day in a chemistry lab, Mr. Dell (& steal time between experi-ments to log onto the Net; my boss sees me banging on this computer & thinks I'm doing company work).

Mr. Dell, being not even a subscriber to the AC enterprise, is not aware of how the AC database got started. If he had read mt article in the June, he would perhaps have more perspective. Where were you last year during the Mail Campaign, Mr. Dell? Sorry if I feel a bit resentful of Johnny-come-latelies who show up after all the hard work is done & then proceed to tell you how it *should* have been done.

And finally, despite the flaws in TurboFile the fact remains that it is absolutely THE most powerful database ever written for our machines. I have employed it successfully & efficiently to genaerate mailing lists for 4 issues of the magazine, with all the complexities involved in that (which I dwescribed in gory detail in the June AC). Aside from the fact that I'm not about to monkey with success, the fact remains that I have neither space in my home nor the time to devote to a total reconstruction of this vital asset. My real job consumes 10 hours/day, & my work on work on the magazine averages 30 hours per week (for which I, like the rest of the Staff, receive no pay).

I believe that TurboFile is a program worth saving & restoring to our market.

Mr. Dell is a computer enthusiast who happens to have an interest in the Classic Ataris, so from that perspective his views are probably valid. My perspective, however, is quite the opposite. I am a Classic Atari enthusiast who just happens to own/use other machines. If I had the outlook Mr. Dell holds, I would not have the inspiration to produce AC. I am totally dedicated to the Classic Atari.

I have to be, else I would have no emotional basis for my near-fanatical devotion to the magazine.

And if anyone should doubt that it takes fanatical devotion, I'll be glad to hand it over to you, so you can see for yourself. The requirements of the operation would crush the casual observer in less than a week.

2456. Apology to Carina

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-14 16:32:12 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <221cec$dee@usenet.INS.CWRU.Edu>
Source record: 105962

I would like to retract what I said in an earlier post about Carina BBS being useless. It is not. BBCS was/is worse than useless. I apologize to Carina and people who use it. I got out of control and did not mean to put down a current product. I had problems back in 1987 with Carina 1.0. I modified the BASIC modules and the board crashed every day. I did get decent customer service, but gave up on it. My apology to Mr. Horanoff. I also have very high regards for Jim Dillow. I'm sure it is a much improved product today than it was six years ago.
I would suggest that first time purchaser's of Carina try it out for several weeks perfectly stock, just like it comes, before modifying it in any way. The beauty of Carina is that it is so flexible that relatively modest 'programmers' can modify it.

2457. MicroMiser

Message-ID: <9307141732.AA02986@smithkline.com>
Source record: 105964

Just responding to Jim King's comments on the XEP80.
The only bugginess I've experienced with my XEP80's (I have several) has been using AtariWriter-80. Those bugs have pretty well been described in AC, & they are all mosly harmless (if somewhat anoying).

I've been using my XEP80's for several years with BobTerm 1.22 & NEVER had a problem. The BobTerm XEP80 interface is very solid, in my experience. I've used BboTerm w/XEP80 on a Supra 2400 modem, on GEnie, CompuServe, a few BBS's, & mainframe VAX (both via modem & hardwired port). No problems ever. Maybe something screwy with your modem or host system?

I also use my XEP80 for all the AC database work, under BXL-SDX. Never a problem with the display.

There IS, I'm almost sure, a problem with the parallel port on the XEP80. It's timeout is too short. If you send a very long file to your printer thru the XEP80 printer port, & you don't have a hefty buffer (like 64K min.), then as the transmission falls further & further behind the printer's capacity to dump the data to paper in time, the XEP80 gets tired of waiting for the printer buffer to clear & will quit transmitting. I used to use the printer port on the XEP80 a lot & only solved my problem with long printouts by installing a 128K parallel printer buffer.

I can't say for sure, but I think early version ROMs for the 850 had this problem too. I think Atari lengthened the handshake timeout in later versions. Can anyone verify this?

For any implications otherwise, I have, and do, apoligize. It was not
clear to me, and so I asked. And as a personal project, I would have
made the same suggestions if you were a personal friend, but definitely
inapproriate for our non-relationship.

To repeat .. I apoligize for any suggestions of impropriety that
may have been implied by my posts.

>Mr. mentions a sum of $2500 that was "being invested in this project". Where he
>got that figure I have no idea. News to ME. Obviously the product of an over-

I read the figure in a post here .. but not having saved the post, I
have no idea where it came from, or even if I may have confused a post
about other software with the posts about your database software.

>active imagination. I have never mentioned any sums of money nor do I intend
>to.
>
>As the how "easy" it would be to find local IBM programmers who would set up the
>application on my 286, Mr. Dell fails to supply details. I'm sure my employer

Not living in your area, would not not know specifics. Local college,
local computer store, local IBM PC user group. All of these are available

here, and I know are valid avenues. I am always getting requests for help
from people and wondering "now how in the heck did they find _me_".

>would just *LOVE* to have me spend several hours of paid time calling all around
>to evaluate the the services of the zillions of IBM programmers in my area. I

I would certainly not presume to suggest you steal time from your employer.

>
>Mr. Dell, being not even a subscriber to the AC enterprise, is not aware of how
>the AC database got started. If he had read mt article in the June, he would
>perhaps have more perspective. Where were you last year during the Mail
>Campaign, Mr. Dell? Sorry if I feel a bit resentful of Johnny-come-latelies

I did not have an active Internet access account, and was thus obviously
bypassed by the mail campaign.

>who show up after all the hard work is done & then proceed to tell you how it
>*should* have been done.

Hmmm ... not to flame here ... I am aware of the high level of emotion
while this was written, but does this mean you won't take help or listen
to advice? Please don't let resentment blind you.

I, for one, appreciate how much work an undertaking like Atari Classics
takes and am glad that someone has taken the initiative to keep communications
open regarding the Atari 8bit machines in a formal publication. But does the
fact that I was unaware of the undertaking diminish my interest? Or make my
opinions worthless? This does not sound encouraging. Now perhaps if I had
been aware of the campaign and silent, and only now butting in ... but
that is not the case. Even if it was, should those with awakening interest
be shut out?

By the way, as a "Johnny-come-lately", are back issues available? And
can I order them at the same time as my subscription (which should go
out by Friday, I can finally see the hobby pile on my desk).

>
>And finally, despite the flaws in TurboFile the fact remains that it is

If it works, and you're satisfyed with it, by all means use it! From the
effort to repair the bug, I thought you were not satisfied with it.

>monkey with success, the fact remains that I have neither space in my home nor
>the time to devote to a total reconstruction of this vital asset. My real
>job consumes 10 hours/day, & my work on work on the magazine averages 30 hours
>per week (for which I, like the rest of the Staff, receive no pay).

I would like to repeat my appreciation for your time and dedication to
breathing life into the Atari 8bit machines.

>
>I believe that TurboFile is a program worth saving & restoring to our market.

Now this seems to be the explanation as to why you pursue the project,
although relatively satisfied with the subscription database application.

>
>Mr. Dell is a computer enthusiast who happens to have an interest in the Classic
>Ataris, so from that perspective his views are probably valid. My perspective,

Minor correction .. suggestions, not views. I was suggesting alternatives,
which happens to be one of the things I do quite a bit, even when my personal
view is completely different from that which I suggest. Though my personal
view that computers are just tools, and whatever is actually used is better
than the most eligent solution not used, was expressed throughout, possibbly
in multiple ways.

>however, is quite the opposite. I am a Classic Atari enthusiast who just
>happens to own/use other machines. If I had the outlook Mr. Dell holds, I would
>not have the inspiration to produce AC. I am totally dedicated to the Classic

>hand it over to you, so you can see for yourself. The requirements of the
>operation would crush the casual observer in less than a week.

And again, is appreciated. See above about my suggestions if you were
a personal friend, and please, don't over stress yourself. Try not to
take on too much without giving yourself some time to recharge. I have
had 2 co-workers striken recently due to stress related problems, and
also have a family history of stress related troubles, so don't overreact
to the inappropriateness of my suggesting that you be careful. The
concern is sincere.

INSOFT-L on LISTSERV@CIS.VUTBR.CZ Internationalization of Software
Discussion List

Internationalization of software relates to two subjects:

1. Software that is written so a user can easily change the
language of the interface;

2. Versions of software, such as Czech WordPerfect, whose
interface language differs from the original product.

Topics discussed on this list include:

-- Techniques for developing new software

-- Techniques for converting existing software

-- Internationalization tools

-- Announcements of internationalized public domain software

-- Announcements of foreign-language versions of commercial
software

-- Calls for papers

-- Conference announcements

-- References to documentation related to the
internationalization of software

This list is moderated.

> talking about. Anything can get skipped.
>
[code and description deleted]

Well, this piece of code exercises an obscure 6502 bug which is fixed in
the 65C02, and I assume also the 65802/65816.

Suprisingly, in my collection of data books, I don't have a 6502 manual. I
do have a photo copy of a 6502 data sheet, but that was useless.

I also have photo copies of the 65C02 data sheets, which is where I found this
bug documented. I also found a mention of it in the book "Programming the
65816, including the 6502, 65C02, and the 65802" by David Eyes and Ron Lichty,
on page 547.

Basically, the text goes like this:
When an interrupt occurs immediately after the fetch of a BRK
instruction on the 6502, the BRK is ignored; on the 65C02, the BRK is
executed, then the interrupt is executed.

This is also mentioned on the 65C02 data sheets, in a table called "Micro-
processor Operational Enhancements."

Finally, someone posted a 6502 Programming Quirks list to c.s.a.8 back
in 9/87. I saved it, and it is mentioned there also.

You said the NMI service routine had the return address of the BRK instruction
plus 2. Since the BRK is a two byte instruction, this would be the return
point if the BRK instruction was ignored. Also, you state that the BRK
bit in the pushed status register is set. I'd say this was never noticed
before, since most NMI handler routines don't check the BRK bit in the saved
status register.

> All responses to this will be most appreciated. This problem has cost me
> months of debugging time over several different projects trying to find
> bugs that didn't exist. It has been an obsession, and I'm eager to talk
> more about it.
>
Of course, this only has to do with skipping BRK instructions. If other
interrupts are being skipped, this doesn't explain it. If an NMI and IRQ
are asserted together, the NMI is definately serviced first, but is the
IRQ then serviced, or does it get serviced only if the IRQ pin has never gone
high during the service of the NMI routine?

Remember the old Rev. A OS ROMs on the original 800? Occasionally, during disk access, the system would go to sleep, and either waiting or hitting the "break" key would bring the disk access back to life. This was fixed in the Rev. B ROMs, and had something to do with missing interrupts, if I remember correctly. Anyone know the details? Is this related?

Just a few things to think about...

John; BTW: My girlfriend spent 100's of hours playing Frogger in the
early '80s on an 8 bit & she wanted me to tell you she thinks it is one
of the best games ever.
I took a look at that code you posted for interrupts. You're right in
that it falls out of what should be an infinate loop & reaches that
border color change code about every second or so. I also noticed two
things. If use a $C0 vs $80 for $D20E you should see 3 colors on PFII
since the VBI restores PFII from the shadow reg during the VBI, but no
go. I also did a little bit more complicated of DLI where it erases a
character & plots another character one over every DLI by just:
ADC 20
TAY
STA ($58),Y
etcetera.
My DLI runs fine *IF* it's installed W/O your BRK loop. With your BRK
loop it randomly leaves characters on the screen at odd locations
=> carry flag seems to be being corrupted by the BRKLP code. I've also
had a ton of trouble with the stack. Quoting Bill Wilkinson, "With an
8-bit you have interrupts occuring all over the place!" I'm assuming that
the BRK status in the P reg isn't properly cleared during the BRKLP so
the OS rather then the 6502 series processor is making the mistake. Have
you ever looked there to see if that's the problem? You are right though,
I get a border color change about 1/sec which seems to indicate an
improper handling of the BRK with transfer going to PC+2 on return.
=>almost like it's exiting through a PLA RTI in the OS vs vectoring
through $206.

Has a version of the game "Short Circuit" been produced for the Atari 8bits?
I've seen it (only) on the Apple 8-bits, but I'd like to see it on the Ataris.

In case you haven't heard of it, the scenario of the game is that you are
working to disarm a device that will blow up the world. It has a number of
microchips in it that can be destroyed by overloading them with power,
there're neutrons running around trying to get you, etc...

Thanks,
Steven Ourada

Source record: 105979

The Grass is always Greener on the other side is a common phrase among 8-bitters.
I'm not immune to the notion.
But when it comes to applications, the 8-bit is capable, with the right memory config and storage media, to tackle
most any task, as TurboFile proves.
After playing with DISKBASE even that is most capable for even large databases.
Since it uses the DISK as the primary storage, not MEMORY, the 64K can be put to use for sorting and features!
I looked into the AMIGA recently, and although it is attractive, the
idea of spending a LOT of money to add SCSI, accellerators,
FPU, SOFTWARE, and DRIVES, will push the initial $150 investment well over
$700-1000 or more!!

When it comes to 16 bit it is hard to "go slumming".

And if I am going to spend THAT kind of money I want a SERIOUS performance increase, and a 7.xx 68000 is just not
going to do that.

People would say that by virtue of x mhz in comparison to 1.79 that the performance increase would be rather
obvious.

I disagree.

In actual operation and practice I find the effective throughput of the Atari 8-bit to be more in the range of
about 5 mhz, something faster overall than a 4.77 mhz early PC.

This is due to the OS and the custom chips and stuff.

Then add a hard drive or large ramdisk and you are essentially running at 16-bit
memory kinda via storing data which most 16 bit systems use memory for in
ramdisk or hard disks.

on my Carina system it is extended even further....

By writing an ML CORE and several BASIC MODULES, you don't need a constant 500K overhead, you can load modules
to overcome the 64K limit.

The workarounds do just that, they work.

Certain things we miss, I'll grant you that, but for the price range it is hard to beat.

And if we work together maybe we can overcome more obstacles, like using
a BASIC XE like programming environment for other languages, as Jim King has
said is being worked on locally in his area.

From: G44@delphi.com
Message-ID: <01H0JTPCQ24O9366OJ@delphi.com>
Source record: 105980

I can not say Carina is perfect...
At its current incarnation it is a mega-patched 2.0 (2.6) and has a couple serious bugs in relation to
message bases and the net which scramble the first 20 messages of a full base.

Plus its file allocation scheme is very limiting, at present only 1 partition per sig, which means adding more sigs
just to add more filebases, kinda kludgy and still an 8 drive limit.

It is at the end of its development curve within the Carina II compatibility
phase and with Carina III it will have the "look and feel" of Carina II but
without the limitations, and be essentially a rewrite from top to bottom,
getting rid of what didn't work, or what was kludgy, and adding the necessary
features of TODAY's telecommunications developments:

High speed
Flexible translation support
-ANSI and CGS, etc...
BANK_MIO/BB filebase support, 128 meg limit per sigs, not bad.
Fewer faster running modules
A faster lower-cost network system
Attached files

etc...

Oh, and a proprietary offline reader system only for 8-bitters that would essentially be a program you run
that is a "mini Carina" offline.

I can claim facilitating the PCPursuit netowork system, which is a boon to the net and potential networking sysops
without much funds.

I also wrote a CGS demo for my board which proves it CAN be done on Carina.

In fact, I could implement it fully if I desired, but noone locally really has te hardware to use it, save sysops
who just want to call quickly and leave.

I will wait for TOM to add more enhancements to CGS -- like cursor positioning,
and to resolve the problems with getting it to run under MYDOS.
TOM is a big SpartoPhile and although he makes concessions to MYDOS/2.5
users he doesn't always make enough
even though as far as CGS is concerned, there is NO reason for it to be
DOS specific!

> executed, then the interrupt is executed.
>
>This is also mentioned on the 65C02 data sheets, in a table called "Micro-
>processor Operational Enhancements."

If you had any idea how many people I have fruitlessly tried to convice
that a bug like this existed, you might be able to understand how
incredible it feels that people have actually documented this thing.

Many thanks Ken for sending this.

>Finally, someone posted a 6502 Programming Quirks list to c.s.a.8 back
>in 9/87. I saved it, and it is mentioned there also.

Could EMail this to me, or repost it?

>You said the NMI service routine had the return address of the BRK instruction
>plus 2. Since the BRK is a two byte instruction, this would be the return
>point if the BRK instruction was ignored. Also, you state that the BRK
>bit in the pushed status register is set. I'd say this was never noticed
>before, since most NMI handler routines don't check the BRK bit in the saved
>status register.

This was one of those 'forest through the trees' things for me. Somehow, I
had never realized that the PC is probably bumped by 2 before being pushed,
so that an NMI at this point would have that address.

The BRK bit in the pushed status register is normally not set. It was set
only in the instance of the skipped BRK, where I had theorized that the
BRK and NMI had somehow gotten fused together.

What may be happening, is that the processor gets as far as adding 2 to the
PC, and setting the B status, and somewhere in this time frame the NMI
takes control.

>Of course, this only has to do with skipping BRK instructions. If other
>interrupts are being skipped, this doesn't explain it. If an NMI and IRQ
>are asserted together, the NMI is definately serviced first, but is the
>IRQ then serviced, or does it get serviced only if the IRQ pin has never gone
>high during the service of the NMI routine?

In the same example program, NMIs are skipped just as easily. And when I
used the $FFFA vector in a more complex example, it means that skipped DLIs
are not caused by something external like NMIST not being set. It's
definately the NMIs.

If the processor is doing the same internal operation with a BRK as it does with an IRQ, the skip could happen in the same way.

Here's another curious point. In the example program, there is no way for the BRK to interrupt the NMI. (Obviously) And yet, either the BRK or the NMI can get skipped. The NMI interrupting the BRK is causing *two* anomalies. That of skipping either one of them. I believe that must be determined by how far along in the internal CPU process the NMI occurs.

There's apparently still one more piece to this thing.

>Remember the old Rev. A OS ROMs on the original 800? Occasionally, during >disk access, the system would go to sleep, and either waiting or hitting >the "break" key would bring the disk access back to life. This was fixed >in the Rev. B ROMs, and had something to do with missing interrupts, if I >remember correctly. Anyone know the details? Is this related?

Well, there were multiple fixes. There was one fix in the B ROMs, but that didn't fix it. Another fix came in the latest XE ROM, and I know someone who knows exactly what they did there. I'll find out and get back here with it. I still have the bug in my 130XE, and I'll have to check if I have the most recent ROMs. I've jumped into the monitor when I had an SIO timeout, and found that the OS had received 255 bytes, and looking at the input buffer, I could tell that there was one missing byte in the middle of the data. I was reasonably convinced that this was caused by the missed int problem. It will be interesting if Atari fixed it, because I had talked to several people about the missed int problem, and it didn't seem like any of them believed me.

Other real world manifestations of the problem could include serial I/O errors in null-modem cable transfers. (Or any serial I/O, but with cable transfers, there are fewer alternate causes). DLI screen flashes when key presses or other IRQs interfere. Missing keystrokes. Have you ever had a missing keystroke where you, "thought sure you pressed that key?"

>Just a few things to think about...

:-) I've certainly had plenty of that.

Thanks,
John Harris - jharris@cup.portal.com

Rick,

Thanks for the Frogger compliment.

>If use a $C0 vs $80 for $D20E you should see 3 colors on PFII
>since the VBI restores PFII from the shadow reg during the VBI, but no
>go.

The reason you won't see the other change, is because the VBI process looks at the stack, and if it interrupted an IRQ routine, (of which BRK is a member), it will exit without doing the shadow updates in an attempt at making the quickest possible return to time-critical code.

I also did a little bit more complicated of DLI where it erases a
>character & plots another character one over every DLI by just:
>ADC 20
>TAY
>STA ($58),Y
>etcetera.
>My DLI runs fine *IF* it's installed W/O your BRK loop. With your BRK
>loop it randomly leaves characters on the screen at odd locations
>=> carry flag seems to be being corrupted by the BRKLP code.

You'd have to take the SBC #1 out of the delay loop. You can replace that part with:

```
TAX
DELAY DEX
BPL DELAY
```

>I'm assuming that
>the BRK status in the P reg isn't properly cleared during the BRKLP so
>the OS rather then the 6502 series processor is making the mistake. Have
>you ever looked there to see if that's the problem?

You're right about the B status, but since there's only one type of IRQ, and one type of NMI going on, the OS makes no such mistakes. Also, my more complex tests disabled the OS completely and used the $FFFA and $FFFE vectors. No mistakes there, and the results were the same.

I think the best one is the austrian Austro-Text. First of all, it`s great
to use the Software-Option for editng and reading 80 Characters per Inch.
On every good monitor, you can work without problems with this display-feature.
Only on TV, it`s a little bit difficult to work a long time with it.

The other thing is, that you can connect the AUstro-Base DataBase with
Austro-Text for Letters or whatever you want. Austro-Text is very good, and
i think there are some Distributors in AUstria today, where you can order
it.

Source record: 105986

Hello everyone,

I'm new to this group. Well, I've been following it for several months, but this is my first post. I've done practically nothing with my Atari for several years except using it as a terminal to log in to my workstation at work. So I have been very 'out of it' as far as new software and developments. I'm planning to subscribe to AC as soon as I get my bills caught up so that I can catch up with the rest of the Atari 8bit world. (What's left of it!)

I'm glad to see once again that some of the best hackers in the world are Atari 8-bitters. I guess that you have to do your own hacking as a community if practically no one, including the manufacturer, is willing to do it for you. I want to thank everyone who has been involved in any way to the continuing existance and development of the 8 bit platform! It requires a lot of dedication to continue this uphill battle which only gets steeper and steeper. Frankly, I don't think I could do it!

I have a couple of problems that I hope someone can help with...

My system was down for several months when my modem died. I just bought a new high speed one - a US Robotics Sportster w/fax (14.4 baud) and am having problems getting it to work at speeds higher than 4800 baud. The problem doesn't have anything to do with other modems or phone lines. I can't even get reliable data transfer between the computer and the modem. When using Bobterm 1.2, I can type 'AT' at 9600 and about 3 out of 4 times I will get 'OK', but sometimes I will get something like 'OK[['. Other times the modem will not recognize my 'AT' (i.e. I don't get any response). If I type 'ATI4' (I think?) to display the current settings, I get some garbage along with the text. When I go to 14.4 (19.2 on Bobterm), the problem only gets worse. Maybe only 1 time out of 5 will get an 'OK' response, most of the time it is something like '^!$jk'. (Is it trying to tell me something? ;) I have let a friend with a Mac borrow the modem to test it out, and he said that it worked flawlessly at 9600. He didn't test it 14.4 though because he didn't think it would work to set the rate on the term program at 19.2. The only thing I can think of is that I am getting some interference from somewhere.

I am using a 800XL with a 256k Newell upgrade and a PR Connection. I have checked all the SIO & modem cables for shielding and they all look ok. All the shielding inside the computer looks normal except for a notch for the upgrade wires. I tried moving the modem about 6 feet away from everything (i.e. the TV, drives, power supplies, etc.). I've even disconnected the SIO chain from the PR Connection to make

sure I wasn't getting interference from further on down the line. I'm very frustrated that I bought a nice fast modem and I'm stuck at 4800 baud (2400 with Omnicom). Any suggestions?

I can use 4800 baud with Omnicom for kermit file transfers with no problems, but for viewing text I lose lots of data if a lot of scrolling occurs cause its tiny buffer (256 bytes?) keeps overflowing. Does anybody know of a hack or something for Omnicom to use the extra memory of an upgraded machine for the buffer? That would be great!!!

I also have another problem...

When my 1050 died, I got an XF551 (now I have two). They were both apparently early models since both were shipped with DOS 2.5 instead of DOS XE. I have found that I cannot get either drive to read the extra sectors of an enhanced density disk. You know, the files with '<>' around them? I think I get an NAK error - I forget. Say a large file begins around the 600th sector and fills the rest of the disk. It can read the file until it gets to around sector 707 and then it dies with an NAK. I have been able to get around this once or twice by using the more.com pager which reads the disk while it writes to the screen (is that called concurrent IO?). As long as the beginning of the file was before the 707 sector, it was able to read the entire file. After using the pager, the drive was able to read any other file on the disk normally. However, I have had trouble trying to duplicate this.

This problem makes a good portion of my enhanced disks useless! I have tried using DOS 2.5, Sparta x3.2d and xf3.2d (high speed skew 3.2) with no luck. Absolutely no problems with single and double density though. Does anybody know if this is a bug in the drive? Can a new rom or upgrade like those from CSS be installed to correct this?

BTW, I found out that the Sparta xf3.2d (high-speed skew) only works on drive 1. If a high-speed disk is put in drive 2, it takes about 3 times longer to read than REGULAR speed! Since most of my disks are formatted in this form, this makes my second drive practically useless also, unless someone is aware of a fix for this program. For those not familiar with what I'm talking about, it is a small basic program that will modify a 3.2 dos disk to automatically read/write/format in high speed at all times on an XF551. It can read non-hs disks also. But like I said, it only works on drive one. Bummer!

I figure if I can't get any solutions here, there just aren't any!

Oh yeah, what are some 'MUST HAVE' files on the archive? (Games, tools, or utilites) I've already got Bobterm, Discomm, MyDos, Superarc/Unarc, and Wedge. Is Bobterm 1.22 on the archive? I could only find 1.20.

Sorry for rambling.... Thanks in advance!

I just noticed Tracy Brooks post about PILL games.

The PILL is a product of Computer Software Services. It allows you to copy games from various sources onto disk. These games only run when you have The PILL inserted in your cart port.

The PILL itself is a sealed module that plugs into the cartridge port. It probably got its name from the fact that it is a chunky white thing, it LOOKS something like a very large pill.

Because you need the special cart to run the games, it is NOT a pirating device.You can copy PILL games & give them to someone else, but they can't run them unless they also have a PILL.

I haver one myself but find it frustrating to use, it's like those other cart-copying schemes where you have to lift up the special device from the slot at some point in the copy process, just a little to clear one foil. I could never master the technique. I think Alpha Systems made a similar device, forget what theirs was called.

The PILL is still available. Contact CSS at 716-429-5639. $24.95. Now in improved version called the Super Pill, doesn't need the switch.

Check the CSS ad in the JUne AC.

> \==/

Well, BLA@KBOARD is really @alled "MEMO PAD." This is the bootup on
400/800's. If you have no @arts. plugged in, and no drives atta@hed, it
will jump to this.

Also, typing "BYE" in BASI@, or "DOS" (if you havent booted with any
drives) and I'm guessing a "? USR(something)" (Dunno where in ROM this
ditty starts) would do it, too. Supposedly, typing "BYE" from BASI@,
then hitting [RESET] will get you ba<k to BASI@ w/o rebooting, and I
think your program is supposed to be inta<t. I'm not positive about this
(so save first! hehe)

As for the "LOGO" .. this is the big, rainbow-@olored "ATARI" that
appears when you do the above to a 1200XL. It may also be the same on
the 1400XL/1450XLD's, but who <ares? Not many people have these gems!

Anyways... Pressing [HELP] from here will get you to the SELF-TEST menu.
Hitting [RESET] from either the LOGO or the SELF-TEST area will reboot
(and wipe main RAM).

Again, getting to these is a simple "Boot w/o @art or Drive" or type
"BYE" from BASI@.

Finally, there's the REST of the 8bits: the other XL's and the XE's.
These have neither a MEMO PAD nor a LOGO. They just have the SELF-TEST.
Booting w/o @art. (AND HOLDING DOWN [OPTION], to keep built-in BASI@ from
starting up) and w/o disk will get you to the SELF-TEST menu, as will
typing BYE from BASI@.

Does anyone know what bit of OS ROM in the XL/XE's is the <ode that
repla<es the old "ATARI"? And how was that image stored? Most likely
not as redefined @hara@ters (??) be<ause [^F4] doesnt do anything to it
(then again the [^F#] keys are killed by BobTerm (why!?)) Was it stored

as a bitmap? Is it drawn when you first boot up? (Ie read from a data table and then the OS PLOT/DRAWTO/XIO-FILL's were used????)

Very interesting question, if I do say so myself ;)

> can't run them unless they also have a PILL.

But it would be construed as a pirating device by purist, and rightly so.
Sure everyone that uses the game off the disk must own a PILL or SUPER PILL,
but not everyone has to own the original game/application/whatever. Once
you have written it to the disk, you could sell the game cartridge or give
it back to it's rightful owner and you now have an unauthorized copy of
the game that you can play to your hearts content.

The only legal use for the PILL is to copy cartridges that you own to disks
so you can protect the original cartridge. Personally, I find such
devices of dubious value since I have had a LOT more trouble with disks
going bad than cartridges. In fact I can't remember a cartridge going bad
on me although I have had to clean some fingers from time to time.

All the best....

2483. Help 130XE Troubleshooting

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-15 20:44:08 UTC
From: meyer%nyneve.dnet@delcoelect.com
Message-ID: <9307152036.AA11059@koedgw01.delcoelect.com>
Source record: 105989

I have a 130XE that died. The symtoms (without a drive hooked up) are a blue screen with the cursor in the upper left corner. There is no BASIC or SELF TEST functions. During an inspection of the inside, I touched a RAM data line and got an error code displayed on the screen. I assume that the processor is working ok. My guess is a bad RAM chip. Unfortunately half of the chips are not in sockets. Does anyone have any suggestions or schematics that might assist me in troubleshooting this problem. I'm trying to use my 800XL schematics as the best documentation that I have.

Thanks,
Marc Meyer

2484. 6502 "bug" or "quirk"

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-15 21:59:28 UTC
From: G44@delphi.com
Message-ID: <01H0KWDL9HGI8ZDXBQ@delphi.com>
Source record: 105995

Okay, what I want to know is, is it a BUG or a QUIRK.
Is it something that screws up programs left and right, or is it something
to be aware of, and program around in anticipation of the skipped BRK?
I believe the issue was when dealing with Non Maskable Interrupts, which you
really CAN'T control, at least not well, one could easily program and fall into
a trap that is not his fault...
One has to proof the program to scan for the possibility of an NMI/BRK/IRQ deal
that would set it off, and try to avoid it.
My question is: for the sample program, IS there a way to avoid it, and
has this BUG afflicted any programs in any way?
I find it hard to believe that the 6502 could be produced over a period of 20 years or so
(if you count the Nintendo
still being sold) with an honest to goodness BUg in it.
That is, of course, if the more modern 6502-based machines use a 65C02...
That would be fixed...
Kinda makes you wonder....

I can only say that I haven't come across any bugs like that that I would attribute to the
CPU.
But it is HARD to find a smoking gun when there are a myriad of possibilities
for a program to CRASH or have little variances in color or what not.

2487. Re: A couple of questions...

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-16 04:03:19 UTC
From: dillera@wam.umd.edu
Message-ID: <2259a7$oob@cville-srv.wam.umd.edu>
Source record: 105998

<marco has probles with 4800+ bps on the Atari.

Af far as I know, you need special cables to HARWARE HANDSHAKE the high speed modem (speeds above 4800) from the atari to the modem.

On my mac (and on IBM & amigas) when using a high speed modem, you lock the modem and the computer at the fastest rate they can handle- say 19.2- and then the modem buffers the incoming/outgoing data at what ever you connect at. Of course, v42 & 42.bis come into effect in switching & massaging the data stream and moving the speeds around, but maybe the atari can't simply handle those insane speeds? (Insane for the 8-bit atari!) They never dreamed of 14.4 over phones back then.

At least I think you need a harware handshaking cable for the high speed. My mac went nuts when I tried to hook up my 9600 bps modem to it- using the oly modem cable that woked fine for years at 2400 bps. i had to go out and buy the NEW h.h. cable- and it works fine now.

Anyone else have direct experience with the Atari & high speed modems??

2488. Re: A couple of questions...

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-16 05:29:04 UTC
From: Bill.Marcum@launchpad.unc.edu
Message-ID: <225eb0$h08@samba.oit.unc.edu>
Source record: 105999

I don't think the PR Connection is capable of 19.2. 9600 on a good day, maybe. For 19.2, you need an MIO or a Black Box interface. The Sparta high-speed patch could probably be modified to work with drives other than D1, if it's like the patch that works with Mydos. Someone would have to disassemble it and look for the tables that set the i/o speed and the SIO command bytes.

2489. PMG "Re-Use"

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-16 12:44:08 UTC
From: coleman@alexia.lis.uiuc.edu
Message-ID: <CA9CpK.M9w@news.cso.uiuc.edu>
Source record: 106040

The following question came up recently in nother newsgroup. I have my own gut feelings about it, but I'd like to run it by some 8-bit gurus and get some additional opinions.

The comment was made that some games re-use their sprites in order to make a limited set appear like more. It was asserted that the Atari 8-bit machines did this on occasion, and the Joust game was cited as an example (i.e. the warbirds were all players which were being cleverly re-used so as to have one player show up as multiple birds in different places on the screen).

After pondring it a bit, it didn't seem to me to be possible in the general case, and extremely tricky in the rare instances where it could be done (if indeed there were any at all). One would have to use DLIs to change the bitmap associated with each player as well as the horizontal position register several times during each display refresh cycle. One would have to insure that the electron beam was scanning a line below the current vertical position of the visible portion of the player bitmap, to insure that it would be displayed. There would also be added complexity in dealing with players which need to appear in certain positions simultaneously. For example, if we have each player representing 4 screen objects (P0 -> O0, O1, O2 and O3; P1 -> O4, O5, O6, O7, etc.) we can't display a situation whereby objects 2 and 3 appear on the same horizontal scan line during the same screen refresh cycle - this would be physically impossible for one player to accomplish. To work around this would require players to be able to dynamically switch the objects they represented, depending upon which objects needed to be represented on which areas of the screen at which times. I suppose it could be done by assigning each player to a vertical band on the screen, and having the player for that band represent all objects which happen to be within that zone for that refresh cycle, but it would be complicated to program. Also, you could never have two objects within the same zone occupying the same horizontal scan line (as noted above).

BTW, we resolved the issue WRT Joust: it's clear that the game was implemented using standard playfield animation techniques - each warbird is multicolored, and players are monochromatic. However, the question of the general player re-use technique still remains. I'd be interested to read the comments of you 8-bit programming experts.

2491. Serial Port for an 8bit

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-16 13:22:36 UTC
From: tmkk@uiuc.edu
Message-ID: <CA9EHo.49@news.cso.uiuc.edu>
Source record: 106041

As some of you may have gathered from previous posts, I'm planning a project which will convert an unused 8bit (an 800) into a dedicated I/O terminal for my HA (Home Automation) system. The HA system will consist of various smart modules all connected via an RS-485 network running over UTP throughout the house. Thus, to connect the 8bit to the HA system, I have to cook up an RS-485 interface for it. I'm trying to work out the best approach given my hardware skills, budget, and time constraints.

One approach would be to cook up an RS-485 version of the R-Verter. For those of you not familiar with it, the R-Verter is a serial interface which plugfs into the SIO port and terminated in a DB25 connector, ready to plug into a modem. It also comes with software (R: drivers, a term package, etc.) and schematics for the device. A buffer chip, the NS75176B RS-485 chip, some resistors and capacitors, and an SIO cable would be enough. The upside to this approach would be simplicity of implementation - I already have a schematic for a device which works for RS-232; with only minor modifications, it could be made to work for RS-485 instead. The downside is that all the grunt work would have to be done by the 6502. Since the RS-485 net runs at 9600bps, this might be tricky, especially since I want the I/O terminal to also do other things, like maintain a system status display and watch for incoming IR commands via the Xanadu Zapper connected to the joystick ports.

Another approach would be to whip up a UART-based serial port. This would be more complex, have a higher chip count, a higher cost, and it would be more difficult to implement since I'm a software guy and not a hardware guru. The upside is that since the hard part is done in hardware via the UART, the 6502 is freed up to perform other tasks. Also, if I were to pick up a used 800XL, I could interface to the parallel bus and the interface could be completely interrupt-driven.

Opinions? Comments? Questions? Which route would YOU take?

[ Specifics Deleted To Save Disc Space And Keep SysAdmin Happy ]

Isn't that why GEM uses *.RSC files? All of the operator interface
is kept separately from the program so that all you need to do is
edit the *.RSC file and ship the edited file with the *same* program.
That reduces the issue to "where can I find someone who can trans-
late all these messages?"

Or am I _missing_ something, here?

2494. Re: Help 130XE Troubleshooting

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-16 17:59:05 UTC
From: popp@fledge.West.Sun.COM
Message-ID: <226q99INNb76@west.West.Sun.COM>
Source record: 106001

You are indeed fortunate! Becasue the 130XE has two banks of memory, it is possible to cross circuit them to determine if one has a bad chip.

Here is the proceedure:

On the circuit board near the memory chips you will find two 33 ohm resistors (color code: orange, orange, black, silver (or gold)) labeled R110 and R111.

R110 feeds the enable line to the primary bank, while R111 feeds the secondary bank.

Disconnect the left side of R111 and jumper that end to +5 volts.
Disconnect the left side of R110 and jumper it to the spot where the left side of R111 used to be.

This will then have the system using the secondary bank of memory as the primary.

If the system then works, you've got a bad memory chip in the primary bank.

The bad news is from there you'l have to trial-and-error replacing chips until you hit the bad one.

I do have offical Atari schenatics if you think they will help.

2495. Re: Emulator to run 8bit programs on PC?

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-16 20:52:23 UTC
From: David James Alexander Hanley <U34465@uicvm.uic.edu>
Message-ID: <93197.155224U34465@uicvm.uic.edu>
Source record: 106004

I too, am interested in making an emulator for the atari 8-bit. Since an
emulator for the 6502 is available, all we need to do is simulate the hardware.
Perhaps we could make it a group project. One person or team of persons for
each chip. I imagine processing display lists is real time in software will
be hard. Than again, most of these screens were only 8k or so.
So mabye not.

2496. Copy protection woes

This is for Richard Dell,

OK, let bygones be bygones.
I appreciate your concern for my well-being. Given the general level of
effort I exert these days, it is entirely possible my stress levels are
a little high. Or at least, a tad higher than I'd like them to be <grin!>.

Yes, back issues of AC- magazine & disk- are readily available. If you'll
e-mail me your postal mailing address, I'll be glad to send you some info
& our handy-dandy order form. Use of the order form is preferred since it
helps keep our Circulation Editor (uh.. who is *also* me) from going bonkers.

Interested parties can always send email to Ben Poehland at:

poehland@smithkline.com
or
poehland%phvax.dnet@smithkline.com

For info on AC. Please include your POSTAL mailing address so I can send
you an order form.

All back issues are well in stock except for Feb. '93 which is almost gone,
I think there's only 8 or 9 of those left.

The cover letter accompanying the form will explain our policies about
ordering subscriptions and back issues.

2500. TurboFile / TurboBase

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-17 00:40:15 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9307170014.AA26238@smithkline.com>
Source record: 106006

This is for Michael Current,

Yah, Michael, you're right, TurboFile IS the "stripped-down" version of TB.
Strictly speaking, it was proably incorrect of me to say that TF was THE most
powerful database, since TB really had ALL the bells & whistles- not to mention
that 700-page manual (!).

It's a matter of perception for me. I just don't think of TB as a "database",
it was really designed for running a business. It's WAY overblown for just
ordinary database stuff, so in my mind it's a whole different beastie. It was
priced at $160 or so, which probably put it in the Top Ten most expensive 8bit
programs. (Uh-oh, now watch, a zillion people will come outta the woodwork
to prove there were 58 other programs more expensive... eeeek!).

I don't see TurboBase as a good candidate for "software salvage". From what I'm
told by MicroMiser the code is very messy, then there's that nasty copy
protection thingy, plus that *lovely* 700-page manual (ugh!). I know a guy in
NJ who bought TB but was so intimidated by the manual he barely used the
program.

MicroMiser's other contrution to XEP80 computing, TurboWord, is an "iffy"
candidate for software salvage. Messy code. Dunno about bugs or the
manual. Jeff McWilliams, AC's Moonlight Workshop Columnist, uses it & seems
to like it (which counts for something, since Jeff knows his stuff).

Both TW & TF interface to TB, both smaller progs are spinoffs of TB.
TW & TF could have a ready market among fans of the XEP80, but TB is too much
of a kludge in my opinion to make any headway in the market (it wasn't exactly
a big seller in its heyday, either).

Just my $.02....

The simplest method I use for reading from the disk is to copy a file to the screen handler via DOS. I issue the "C" command, then "FILENAME.EXT, E:". The 1.79 MHZ ATARI is slow enough that I can then stop and start the screen display with CONTROL-1, which is the ATARI OS equivalent of CONTROL-S / CONTROL-Q. Not very classy, but it gets the job done.

2502. Re: 6502 "bug" or "quirk"

l
>that would set it off, and try to avoid it.
>My question is: for the sample program, IS there a way to avoid it, and

The bug will eventually occur if the interrupts are allowed to mix freely.
The only possible way to avoid it, is not to allow NMI/IRQ/BRK to occur at
the same time. This can be very difficult to do, depending on the nature
of the program.

For instance, if you have either VBIs or DLIs running, you cannot do any
free format IRQs like keyboard or POKEY serial interrupts without
generating skipped ints. Most people wouldn't find a rare screen flash, or
one extra serial I/O error that objectionable, but it's still a bug. What
I had to do in my program, is disable keyboard IRQs and process keystrokes
from the $D209 hardware register directly. And when doing serial I/O, I
have to put up a temporary screen with no DLI's.

I attempted to get around the BRK problem in my debugger, by placing BRKs
at both the requested address, and at the address+2. While this catches
the missed BRKs, it also causes problems when branching code gets to the
address BRK+2 without going through the BRK itself. I eventually removed
the routine from the debugger, since it caused more problems than it fixed.

>has this BUG afflicted any programs in any way?

You bet. See my earlier examples of SIO timeouts, screen color flashes,
Bug/65 lock-ups, and others. I think most programs are affected in some
way, but just a small enough way that most users don't notice, or don't
care.

Also, realize that this bug is quite rare. My BRK example generates about
37,000 BRKs per second, and on the average, only 1 or 2 per second are
skipped. Even fewer DLIs. That's an incredibly small percentage, and
unless your a purist, it's not likely to be a big deal.

>I find it hard to believe that the 6502 could be produced over a period of 20
y
>ears or so (if you count the Nintendo
>still being sold) with an honest to goodness BUg in it.

This is why I had so much trouble convincing people it existed. The rarity
and alternate explanations outweighed my beliefs.

>I can only say that I haven't come across any bugs like that that I would attr
i
>bute to the CPU.
>But it is HARD to find a smoking gun when there are a myriad of possibilities
>for a program to CRASH or have little variances in color or what not.

Yes, there are often several explanations for a particular program quirk,
and the last thing that would come to mind is a failure of the CPU. This
is why it took me so long to find out what was really going on. Most of
the time was spent trying to find non-existant bugs in my code.

I'd venture that everyone who has used the 8 bit has seen an instance of
this problem, but didn't realize it.

2507. Transparent Banking

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-17 15:19:53 UTC
From: G44@delphi.com
Message-ID: <01H0NB3ZHZAQ8ZEA1H@delphi.com>
Source record: 106015

Transparent banking means not having to press Start B or anything.
It will automatically distribute the text into the banks and also scroll through the banks without
you even knowing that banks are being used.
Paperclip, I hear, stores every line as a string which is kinda wasteful, but
still, it is the only WP of its kind I know of, and the technique is a
desirable one to employ on upgraded machines.

I think Kit was responding to this.

From article <9307151916.AA13961@smithkline.com>, by Ben Poehland:
> Because you need the special cart to run the games, it is NOT a pirating
> device. You can copy PILL games & give them to someone else, but they
> can't run them unless they also have a PILL.

If you distribute the software, it's piracy. I can't believe Ben
doesn't realize this. Why would you be giving copies
of games to people who can't run them? And what if they buy a Pill?

(Anyway, it would seem possible to alter a 'Pill game' so it
doesn't require the Pill.. isn't it?)

I won't accuse anyone of anything. The Pill does have it's uses;
physical problems make cart switching difficult for some. And menu
operations are nice to have.

2509. FTP sites/FAQ for Atari 8 bit?

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-18 01:33:39 UTC
From: syzygy@eskimo.com
Message-ID: <CAC6w5.AoC@eskimo.com>
Source record: 106018

OK, I realize I'm probably the millionth person to ask this, but is there a FAQ list for the Atari 8 bit? What about FTP sites? I recently dug out my old 800 and would be interested in any information about it. I'd like to see what I can make it do. Software would be neat, but I only have a tape drive and no way to get information on to the Atari other than typing it in (that I know of) so I guess I'm mostly looking for text files with neat information about programming, building add-ons, etc.

Actually, is there an easy way to use the peripheral port or joystick ports to transmit and receive information? How hard would it be to build a serial interface to my PC? Do I need to pay money and see if I can locate an 850 RS232 interface, or can I just rig something myself? I only have Atari BASIC and no real knowledge of assembly/machine language programming, though I'd like to learn it and I think the relative simplicity of the Atari would be a good place to start.

Thanks in advance...

P.S. Anyone want to sell me an Atari disk drive for cheap?

You can do the same thing without the Pill. The copy the Pill
makes is just a raw dump of the cartridge ROM. It just write
protects the RAM in the cart address space, since the protection
used on cartridges writes to the cart space to see if its in
ROM or RAM. Its also fairly simple to replace the MMU PLA to
do the same thing as the PILL.

>I won't accuse anyone of anything. The Pill does have it's uses;
>physical problems make cart switching difficult for some. And menu
>operations are nice to have.

I personnally don't like where the cart slot is on the 130XE,
but you still have to put the PILL in to play the games.

IMHO: a bug is a bug is a bug. Now that it's been pointed out to mem I
can do little more then 'wish' it wasn't there, but it really seem to be
real.
You'll probably get a couple of answers, but here's mine.
I've been programming in M/L for about 16 years & have never used that
type of control structure so for 99% of what you write it could be
avoided with just a change of style. *BUT* I've never written a monitor
or debugger where that type of control is used EVERYWHERE. All those
single step commands in the ED/ASM or MAC/65 or Omnimon or etcetera use a
BRK instruction to regain control of the the program. Ergo for some
people it's indespensable.

I haven't used an 800 in years, I stupidly sold it :-(, so I don't know what serial interfaces are around. I bet there are smaller, simpler, RS232 interfaces available, and you'll probably learn about those.

But, if you are interested in hardware & low-level software hacking, making a working serial interface shouldn't be too hard. If I remember correctly, you can use the joystick ports as a poor man's parallel interface. If so, you should be able to easily get 8 bits of data and some control lines coming out there.

At this point, you need to interface these signals to RS232 serial. There are two things you need: the standard serial handshaking (start, stop, data bits) at the right speed, and the right voltage level (usually +- 12 V). You'll want to use some level conversion hardware for the second part. As far as the protocol is concerned, you might be able to fake this is software for slow baud rates. The better solution would be to get a simple parallel/serial transceiver (UART) to convert 8 bits of parallel data to a serial stream. Simple UARTs are fun, and dirt cheap. I recommend a 6402.

My guess is the hardware would cost about $10 or $15. If you want to pursue the hacker approach, feel free to send me email and I can try to answer your questions...

HEY! Sin<e when is the [HELP] key stupid? It's just not IMPLEMENTED!
The most likely reason - 400/800 @ompatibility... but then there are
things like SpartaDOS 3.2, TurboBASI@ XL, Qui<k, and on and on.. these
are all "XL/XE required!" programs (and programs written in TBXL are
XL/XE dependant, as are most/many/all? Qui<k programs). Guess what? The
only systems (that stupid ol' I know of) that DONT have [HELP] keys are
the non-XL/XE's!

I've on o<<asion used the [HELP] key in my programs, but I opted not to
for a while (ba<k when I knew nothing) when I thought only the funky
little 1200xl's had them (along with the [F#]un<tion keys).

Anyways... pressing [HELP] for help makes a lot more sense then [^O],
like you already do in Qui<k! :)

Chad Beeder (syzygy@exkimo.com) writes:

>...is there a FAQ list for the Atari 8 bit?

Yes. It's posted here on a regular basis. Watch for it.

>What about FTP sites?

The official Atari 8-bit archive site is atari.archive.umich.edu. You want the Atari/8bit directory, of course. I believe this site is mirrored somewhere, but can't remember where. Anyone?

>I recently dug out my old 800 and would be interested in any information
>about it. I'd like to see what I can make it do.

You've made a good start, hooking up with this newsgroup: welcome aboard! I suggest you send $25 to Ben Poehland (whose address(es) appear/appeared in a posting just a few slots before this one) for a year's subscription to Atari Classics, _the_ remaining Atari 8-bit publication. I think you'll be amazed at what the ol' Atari 8-bit can do; I never put my Atari in a closet and am STILL amazed by the current crop of wonders.

>Software would be neat, but I only have a
>tape drive and no way to get information on to the Atari other than
>typing it in (that I know of) so I guess I'm mostly looking for text files
>with neat information about programming, building add-ons, etc.
>Actually, is there an easy way to use the peripheral port or joystick
>ports to transmit and receive information?

Oooh... that's a a bottleneck all right. Cheap solutions w/o building things might be:
- a disk drive; Atari disk drives are dirt cheap these days; someone recently posted here about getting a computer and two 1050's for $5! Couldn't you just DIE???
- an Atari SX212 modem; can be plugged right into the SIO daisy chain w/o additional hardware a la the Atari 850. Drawback: requires a special handler to be loaded into the computer. You'd have to either get the handler onto a tape, or get a disk drive and get the handler on a disk...
- get people from this newsgroup who still have tape drives (I have one, but it's been years since I operated it and I don't know if it still works) to mail you tapes with stuff on it.

There's at least one third-party commercial product (is it the P:R Connection, gang?) that uses the joystick ports to drive a modem, but again you'd need to get the driver and some way to load it in...

>How hard would it be to build a serial interface to my PC?

It's been done! There's a project called SIO2PC that does EXACTLY what you want: makes a PC emulate an Atari SIO-connected disk drive. You can even boot off it. There are some text files etc. on the Atari Archive FTP site.

>Do I need to
>pay money and see if I can locate an 850 RS232 interface, or can I just
>rig something myself?

There are still a number of vendors selling Atari 8-bit stuff, and I believe 850's ought to be fairly cheap these days... A vendor list gets posted here about as often as the FAQ, or you could post a request for the maintainer to mail it directly to you.

>I only
>have Atari BASIC and no real knowledge of assembly/machine language
>programming, though I'd like to learn it and I think the
>relative simplicity of the Atari would be a good place to start.

I agree. After years of VAX/VMS, Unix, and Amiga, I still love the Atari 8-bit because it is both FLEXIBLE and POWERFUL, while still being of a size and scope that a single individual can understand the ENTIRE SYSTEM. Try saying that about any other computer!

>Thanks in advance...
>
>P.S. Anyone want to sell me an Atari disk drive for cheap?

Where are you? Hit the garage sales, Swap Sheets (local buy/sell/trade newspapers), Goodwill stores, thrift stores, in addition to this newsgroup...

> So mabye not.
>

Someone has done this on ST line of Atari computers (His name
eludes me at the moment) The sound capabilities of the 8-bit far exceed
the standard PC (Even a '486 I might add - Even if you did square wave
oscillations by cycling frequencies very quickly you still couldn't
approximate the 8-bits true sine wave generation) The standard PC is
woefully inadequate for Multimedia unless you purchase additional sound
cards and accelerator video boards to speed up the graphics. On another
note, the graphics on a PC are generated by using bit planes and the
Atari relies on synchronizing its graphics with the CPUs clock. In add-
ition, there would be no easy way to emulate/simulate player missile
graphics on a PC. There are many variances of luminance and hue which
even the PC could not approximate (granted, this is low-res but still
it has a very advanced graphics capability even by todays standards)
You would need to have experts in both the CTIA/GTIA/ANTIC and SVGA,
POKEY and Soundblaster/AdLib. Assuming you could get a motley group
like this together, they would spend an inordinate amount of time
designing (or using) special cards/chips to produce this emulator.
The truth is, the Ataris design is distributed to offload as much as
possible to dedicated chips. Something the multimedia pundits fail
to point out is that very few PCs come with this capability built in.
(VL-Bus might be an exception though) It's something that the old 8-bit
Atari has had for 15 years now (and the PCs are catching up/passing
just recently)

Just curious Dawn, but what version of AnsiTerm do you have? Is
it one of the beta versions or 1.0?

Hi all.

I have both an 850 and an MIO. What I'd like to know is whether there's any reason to keep the 850. One user needed one, and both the 850 and MIO are currently collecting dust....Also, what's the going rate for an 850?

One other dumb question....what's the difference between "Summary" and "Subject" in the newsgroups? And, which one is used when nn is giving a short blurb about the messages available (the message selection thinger when one is in a newsgroup)...

Hasta,
Matt Koundakjian (eaeg254@orion.oac.uci.edu)

2526. Re: Emulator to run 8bit programs on PC?

There was an attempt in one of the video games groups to organize an effort to produce an Atari 2600 emulator for the PC (to run carts that were somehow downloaded to disk). Besides the obvious copyright issues involved in doing this, they quickly found out, as they dug deeper into the problems, that even the limited hardware of the 2600 would be very challenging to completely emulate in software on the PC. The 8-bit would probably be even more difficult to emulate.

Hola mundo.

Yesterday, I saw "Cannonball Run II" on C-TV.
In one scene, one of the runners played a video game in his own car...
it was the 2600 version of PacMan.

Many other movies uses Atari games and animations. I can remember
2600 Basketball from "Airplane" (that's the name? It was translated to
"Y... Donde Esta El Piloto?").

Does someone recognize some other Atari game or screen in 90's movies
or TV series?

Bye... ++V

Attention Atari 7800 collectors!

I have access to a limited number of the following Atari 7800 video game cartridges. These are NEW, in the box, in the shrinkwrap, with manuals. I can sell these for $5 each plus $1 per cartridge for shipping, up to $5. Please send me Email if interested!

The number next to the title is how many are left.
Pole Position II - 10
Jinks - 3
Choplifter - 10
Robotron: 2084 - 8
Crossbow - 3 (two not in shrinkwrap)
Hat Trick (hockey) - 2 (No shrinkwrap)
Food Fight - 1 (No shrinkwrap)
Asteroids - 2 (one not in shrinkwrap)
Ballblazer - 3
Xevious - 1 (No shrinkwrap)

A few of these are no longer in the shrinkwrap, but the package is in good shape, and I have tested the cartidges myself to ensure that they work.

From: sourada@iastate.edu
Message-ID: <sourada.743134108@vincent1.iastate.edu>
Source record: 106047

It can indeed be done. Here's a general outline of a way to do it:

In the VBI routine:
Process the movements of the virtual players
Map the virtual players onto the real ones (a number of ways exist to do this)
Move the player data into the player memory
Make a (top-down ordered) list for the DLI's to use to change the horizontal position registers (and colors, if you want)
Set up the lines on which DLI's should occur

In the DLI routine:
Figure out which registers to change and change them from the list made up by the VBI

This is obviously simplified, the actual job of coding something like this is not terribly easy. But, it can work.

Not wanting to start a flame war or anything, but rather just wanted to
quickly respond to a couple of points in your post:

In <8eDw7B2w165w@cybernet.cse.fau.edu> jsupe@cybernet.cse.fau.edu (\) writes:

>David James Alexander Hanley <U34465@uicvm.uic.edu> writes:

>> I too, am interested in making an emulator for the atari 8-bit. Since an
>> emulator for the 6502 is available, all we need to do is simulate the hardwar

>The sound capabilities of the 8-bit far exceed
>the standard PC (Even a '486 I might add - Even if you did square wave
>oscillations by cycling frequencies very quickly you still couldn't
>approximate the 8-bits true sine wave generation)

True enough.

>The standard PC is
>woefully inadequate for Multimedia unless you purchase additional sound
>cards and accelerator video boards to speed up the graphics.

I'll agree with you WRT the sound card (BTW, even the most basic AdLib
sound card supercedes the 8-bit's sound capabilities), but the graphics
don't necessarily need any acceleration to be adequate, especially for
the project under discussion.

>On another
>note, the graphics on a PC are generated by using bit planes and the
>Atari relies on synchronizing its graphics with the CPUs clock.

This in and of itself need not preclude an emulator from working.

>In add-
>ition, there would be no easy way to emulate/simulate player missile
>graphics on a PC.

Au contraire - ever played Commander Keen? The sprite graphics system employed
in that game, though entirely done in software, does everything the 8-bit
PMG system can do and more.

>There are many variances of luminance and hue which
>even the PC could not approximate (granted, this is low-res but still
>it has a very advanced graphics capability even by todays standards)

Again I must disagree. Even a lowly standard VGA can display 256 colors at
once out of a palette of 256,000 - this far exceeds the Atari's color
display capabilities, even the special purpose demos which use DLIs to
display all 256 GTIA colors simultaneously. A VGA card can do it with no

interrupts at all, and with higher resolution.

Furthermore, most PCs today come with SVGA cards, capable of 256 colors in high resolutions (800x600, 1024x768) and also of more bitplanes (e.g. the 32,000 color modes, or the higher end cards with 24 bit color). Emulating the colors would not be a problem in most cases. The PMG system, however, wouild need to be duplicated (and ID Software's sprite system isn't widely available just yet... ;-)

>You would need to have experts in both the CTIA/GTIA/ANTIC and SVGA,
>POKEY and Soundblaster/AdLib.

Very true.

>Assuming you could get a motley group
>like this together, they would spend an inordinate amount of time
>designing (or using) special cards/chips to produce this emulator.

See above - no custom chips required.

>The truth is, the Ataris design is distributed to offload as much as
>possible to dedicated chips.

True, but irrelevant. When you have a 32 bit processor operating at 33+MHz, you have plenty of horsepower to emulate 15 year old custom chips running at 1MHz.

>Something the multimedia pundits fail
>to point out is that very few PCs come with this capability built in.

I think that "very few" is inaccurate these days, but I'm willing to be convinced if you'll kindly cite a reference to the sales data from which you drew that conclusion. ;-)

In short, if anyone out there is interested in developing an 8-bit emulator for PCs, don't be discouraged by posts like this - it really COULD be done. It might take some genetic engineering such as combining a John Harris clone with a Peter Norton clone to produce the ultimate dual-platform programmer for this type of project, however! ;-)

>type of control structure so for 99% of what you write it could be
>avoided with just a change of style.

Just to refresh, it effects more than just the BRK instruction. It effects any IRQs and NMIs if they are used together, without some way of assuring that they doon't occur at the same time. This is not likely to be easy to do in most cases.

Most programs ever written will be subject to this bug. However, skipped interrupts don't necessarily create major problems. Most will either be completely transparent, or such a small and infrequent glitch that it will go unnoticed/uncared.

>Ok... I wanna know HOW to <hange the modes... the first (and only!) time
>I <ame a<ross this was when I saw the OUR5oft demo. I WANt THOSE
>ISSUES OF ANTI@!!!!!!!!

I finally got a chance to see the OUR5OFT demo. It didn't run clean on my machine for some reason, but it did show that they were using the same method I described for getting mixed modes on a scan line. It's just a matter of changing GPRIOR into a GTIA mode, and then back to zero. Why the ANTIC chip pops into mode $E because of this, is probably a bug. (or quirk) :-) By definition, it should have returned to mode $F, which is what I was trying to get it to do when I stumbled upon this trick ny accident.

>And re: Hyper E:, it's just a little (just over 1k) repla<ement handler
>for the OS E: driver. I've had problems with the one I use, so I dont
>use it too mu<h (1) some programs timing is handled partly by the amount
>of time s<reen display takes... 2) some programs don't work with it (at
>least I'm guessing some wouldn't..?) 3) it has a bug (the version I
>have) with ES@ape <odes.)

Check and see if the verion number printed on your Hyper E: is '1.2JH'. If not, you don't have the latest version, and that one does have some compatability problems. To address your questions,

Only $90 bytes remain installed in Hyper E:.
1) Nothing can be done for the timing, except, slow it down. :-)
2) I haven't found any programs that don't work. I sent it to Tom Hunt right after I modified it, and he said every program that failed on the previous Hyper E:, worked with the new version.
3) Mine prints Esc codes okay, unless I don't understand what you mean.

>Not only does it do this 3-mode/line tri<k, but it also displays 24
>player/missles on the s<reen (oops... 25 hehe 8 3-<olor'ds plus 1
>single-<olored) ...

There's never more than 2 double players per line, so there's nothing that exotic here. Although, if they have a really nice managment routine for doing this -- that could have general purpose use, I'd like to see that.

I haven't gotten any responses about the morals/legality of distributing some of the development tools I have. Again, these were originally in house tools for Synapse, which I picked up from them while I was working on projects with them. They have extensive mods done by me, but of course still contain much of their original code. One of the programs displays 'Synapse Confidential' on the main screen. To the best of my knowledge, these programs were never sold to the public, or sold to anyone for that matter. Therefore, where do the distribution rights sit with a product like this?

All right. I'll admit it. I'm a bit surprised that no one has asked to see the partially completed games I have, that were mentioned a little while ago. Perhaps I scared some people off when I suggested someone might want to help finish them. That wasn't a requirement. I would be happy just to get some feedback on them. Perhaps I just didn't give enough info to generate interest, so here goes. One of the games is similar to the arcade game 'Bag Man'. In fact, Synapse was negotiating for the rights to it, but the deal fell through. The game is graphically complete, and runs, but most of the collision detection is not implemented. The other game is a board game called Manuevering. This is playable as a two person game, but the computer strategy is, most likely, a dead-end. The AI routines are probably the most exotic to ever be attempted on an 8 bit machine.

John Harris - jharris@cup.portal.com

2542. Re: Sound off with John Harris

Source record: 106054

Here's an interesting set of routines I developed for managing DLI's. It works well for applications where you need to do a lot of manipulation. It works by setting up three tables. One stores which lines have DLIs active. The other two store the colors that get stuffed. All three tables need to have a length equal to the number of scan lines. To use the routines, put the color you want in the A register, the scan line in X, and JSR SETDLI. To remove a DLI, do a JSR CLRDLI with the scan line in X. You can also use an $FF in the A register to set a DLI without setting a specific color. The DLI will then use whatever is already in the color tables. This can be really useful to make lines pop up in a new color, without needing to know the color of the rest of the screen. Do a SETDLI with the desired color on the first line, and a SETDLI with $FF on the last line. Just make sure you use the SETCOL routine to fill the color table with the proper values first. The SETCOL routine uses what I find a convenient way to compute the intensity color as best contrast to the backround. Thus, only one color value needs to be declared.

What the DLI itself does, is look at the VCOUNT register, and compare it with what scan lines are supposed to have a DLI turned on. This is the way I got around having only two line resolution in VCOUNT. The tables allow DLIs to occur on even or odd scan lines, including adjacent lines. When DLIs are adjacent, the interrupt will stay in the routine to update successive lines. It will not exit until the next line has no DLI. SETDLI and CLRDLI automatically maintain the proper setting and clearing of DLI bits in the display list to make this happen.

These routines are set to work on a standard Graphics 8 screen. To work in GR.15, change the byte at SET4F to $3E, and change the DLI to set your desired colors. For any other modes, the changes would be significant, and overkill. The reason this routine exists, is because VCOUNT cannot give single line resolution. For all multi-scanline graphic modes, VCOUNT can point to the exact location. Thus DLITBL would not be needed, and VCOUNT can be used as a direct index, (shifting right if necessary), into color tables.

Anyway, here's the Gr.8 routines:

I just dug up my old Enchanter disk and it wont boot, appears to have a #
of CRC errors on the first side.... I have checked the back side and it
appears fine...

Could someone out there send me a diskcomm of side 1 or instructions on
how to repair it?

I own the game and have the original disk, so would appriciate any help

Actually, I think the 8 bit would be easier. I've seen the emulator code
for the ST, and while it's not real-time, it is a pretty complete
emulation. A fast IBM clone could do an even better job than an 8 MHz ST.
Almost anything can be emulated if you have enough power.

On the 2600 though, it's a bit harder. There's so many aspects of 2600
programming that rely not on what you do, but *when* you do it. It has to
be +/- 0 cycles in many cases. Getting that kind of accuracy, or finding
some substitute, would be a real challenge.

I don't know what SDX's special devices are. It works with SD 3.2. All I
can say, is to try the new version, and if it doesn't work, let me know
what's wrong.

>The comment was made that some games re-use their sprites in order to make
>a limited set appear like more.

It's definately been done in quite a few places. The easiest ones are games like Frogger, where the players never cross each other. But it's still very possible in more complex examples. Virtually every 2600 game has to do this since it only has 2 players available.

You don't have to worry about the player data itself, since the entire screen height is just sitting in memory anyway. You do need DLI's to switch the player locations, but those can be computed from the player positions. It's the kind of stuff that makes programming an 8 bit 'fun'.

On a related note, it's really fascinating to me to look at the progression of the graphic chip set from the 2600, to the 8 bit, to the Amiga. At each step, the new design has addressed the biggest programming challenges of the previous chips. I'll use PMGs for example. In the 2600 you had no DMA, and all the graphic registers had to be stuffed in real time. That's a lot of work. In the 8 bit, you have to move the player data in the up/down direction manually, and as pointed out, it can be a lot of work to generate multiple players. The Amiga chipset gives full X-Y positioning while retaining player size up to the full height of the screen. In addition, they can automatically generate interrupts at the completion of a given object, and automatically be placed at a new X-Y location -- all without any CPU involvement.

>
>Anyone remember this one?

I did a game like this called Chase, but I don't think that's the one, since it only had one enemy. In any case, the game design came from an arcade game, (of the same name I think), in the very early days -- like the Pong and Tank era.

Hmmm, I didn't even think of this one when I came up against Atari and Midway in a lawsuit over Jawbreaker infringing the copyright of Pac-Man. The example I used, in an attempt to show that their maze chase game idea was not unique, was the game Head-On. A car in a rectangular maze, eating dots, being chased by computer controlled enemies. It's really pretty close.

If any of you have seen the Jawbreaker version that has a plain rectangular maze, what you've seen was the court 'prop' that I used to show a game in between Head-On and Pac-Man. It was never supposed to be shipped, and it was an accident that it got out. The third Jawbreaker maze was an attempt to cover that up, since On-Line had already announced the new version with the dual tunnels. Oh well...

Hi there!

I really like my Atari, but I'm using a very stupid Text-Processor: 1st-Word+. It's really to slow to edit and print a Text of 200 pages or more. Now I'm looking for a converter for my 1st-Word Files to a PC-Format (Word, WordPerfect etc.) or even LaTeX (this would be the best!). Does anybody know such a program? The only thing I found on FTP-Servers was 1stw2ps, a converter to PostScript. This is fine for printing, but not for editing.

Thank's in forward!
Elmar Billen, Muenster, Germany.

I know that I saw Atari Computer Basketball in some movie once, but I can't remember which one. Also, some movie ended with the "The End" screen from the arcade version of Missile Command.
On a related topic, the first song on one of the Cars albums has sound effects from Missile Command at the beginning (again, I can't remember off hand which album or song it was, but it was one of their earlier ones). Since the sound effects for the arcade version and the computer version were _exactly_ the same, I don't know which one they brought into the studio for recording. I wonder if Atari asked for royalties :-) I either read or heard that the arcade version of Missile Command used the POKEY chip for its sound effects. Can anyone confirm this?

This is the second post to the same subject I have seen, and I'm surprised nobody has pointed the following out: the Atari (i.e. POKEY) does not do true sine-wave generation! In my memory, most of the sounds it makes are merely modulated square waves (controlled frequency and amplitude, as well as pseudo-random sequences). Only by using the "volume-only" modes can you approximate sine waves, and that with only 4-bits per sample (ugh)! Am I missing something?

>like this?

Well, Synapse later became part of Broderbund, which I assume is still out
there. So ideally I think you'd like to get yourself a little statement
from Broderbund saying that they don't care about their 8-bit Atari Synapse
software copyrights anymore.

Probably a large bother, but I think that'd be the legal way to go.

The arcade version of "Missile Command" (which I always thought was a
Williams game, was it not?) appears in "Terminator 2" - the giveaway
being the well known "THE END" screen....

Also, throughout the 80s, Atari got plenty of product placement opportunities.
Notable ones were in D.A.R.Y.L. (some niftily speeded up shots of "Pole
Position", running on an 800XL).

There was also a line in "The Goonies" :
"1492. Is that a year?"
"No, it's your high score on Pole Position!" (a slur indeed !!!)

Not forgetting their most famous placement of all - the enormous neon Atari
logo in "Blade Runner".

Eric Anschuetz (eric@ntsc-rd.navy.mil) wrote:

This sort of thing is becoming increasingly popular. The track "Numb" on the
latest U2 album, "Zooropa", has an "Arcade Sounds : Brian Eno" credit....
They sound very "Space Invaders" like....

Cheers.

Tony.

Ah, nothing like good ol' technical discussions about the 8bit!

With regard to getting more than 4 players out of your Atari 8bit,
Steven D Ourada (sourada@iastate.edu) wrote:
: It can indeed be done. Here's a general outline of a way to do it:
[deleted]

At one point in my life, I thought about writing a generalized
version of a multiple-player DLI/VBI routine like this, but never
came up with a satisfactory resoluton of what, exactly, to do
when you want, say, 8 of your "virtual sprites" on the same
horizontal line.

You may notice on Joust (and on Ms. Pac Man, if I'm not mistaken)
that in those rare instances when you can cause more than 4 (or
2, if they're multicolored) virtual sprites to appear in the same
horizontal band, horrendous flickering occurs. I presume that the
VBI in that case decides to devote alternate screen refreshes to
alternate players. Now that I think about it, it wouldn't be THAT
hard to write a generalized routine to handle multiple virtual
sprites. If only I had the time....

Norman

In case anyone cares, you'll notice on this movie that the shots of the
game are (not surprisingly) patched together inconsistently. The kid
playing suddenly jumps from having about 3 seconds left to having about
40 seconds left. (And no, he didn't cross the checkpoint.)

It is a 5V supply, about 3 amps- so get a switching
regulator that can deliver 5 amps. Three pins are for +5 and
three pins are for ground. I don't remember which pins are which,
just that they oppose each other. Take the cover off and check.
Find the processor, pin 40 should show continuity to the plus side
of the power jack. The rest is academic.............sq

(radio shack sells the plug you need- anyone carries switching
regulated 5V power supplies. Anyone EXCEPT radio shack....)

I have witnessed Darek Mihochka's PC emulation of an Atari 8-bit. He brought it with him on a 386 laptop (!) to the AtariFest in Chicago in '91 (I believe). It ran Atari BASIC, a little slow, but it was working. Apparently he had trouble with Atari allowing him to release their 8-bit ROMs in another product...so I think he tabled development.

Apparently Darek Mihoka (creator of the ST 8-bit emulator) began such a project
several years ago, and from what I hear he actually had a working demo. I read
one of his posts a long time ago that when he demoed the software at a pc
convention, nobody really took the project seriously so he abandoned it. I
believe Darek can be contacted via e-mail at darekm@microsoft.COM. Someone may
want to contact him about completing the emulation. BTW, Darek is also the
creator of the Gemulator (the Atari ST emulator for the PC). And no, his
8-bit emulator will not work on the Gemulator :(;however I did hear that he
was going to modify it so it would work :)

>just to get some feedback on them.

In my particular case, I was so blown away by the mere fact of your appearing here, that it completely escaped me that you offered to share your partially-completed games with us! I'd like to see 'em, myself, and dare I presume to have any kind of skill worthy of adding code to them? (Or, dare I presume that my feeble software development tools will be up to the task? Recent experience suggests otherwise...)

2562. Sega gun -> Atari gun

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-21 03:45:58 UTC
From: phruby@ucrengr.ucr.edu
Message-ID: <34401@galaxy.ucr.edu>
Source record: 105922

Back by popular demand!

Sega gun to Atari gun conversion.

From Antic Magazine, August 1988, Vol. 7, num. 4
"First look: Inside the XE Game System: Hardware surprises revealed!"
by Matthew Ratcliff
page 45

To modify the Sega gun for the Atari, you'll have to cut off
the incompatible connector. The wires must be stripped back and soldered
into an Atari joystick connector as follows:

SEGA GUN ATARI JOYSTICK PORT
Blue wire Pin 1 stick FWD
Gray wire Pin 6 trigger
Green wire Pin 7 +5 volts
Black wire Pin 8 Ground

Because of the close fitting connections for the XEGS ports,
don't wire in a DB9 female connector that has "ears". Most joysticks
don't have wires for unused signals, so cutting up an old joystick cable
may not work. Specifically, an Atari joystick does not need the +5 volts,
so there isn't likely to be a wire connected to Pin 7. However, you
can find joystick extension cables at Radio Shack, which have all nine
pins wired from male to female. Antic disclaims responsibility for any
damages that might occur during improper implementation of this, or any,
hardware modification project we publish.

Once it's all hooked up, you'll notice that gun fires when you release
the trigger, which is annoying. The Sega trigger wiring is the opposite
of what the Atari light gun uses. To rewire the trigger switch, remove the
five screws (one is under the Sega logo on the side). Find the trigger
micro-switch with three connections. Wire to the normally closed contacts
instead of normally open.

Does the 850 need a disk based driver or is it in the interface's ROM?

Thanks in advance,
Scott

John Harris (jharris@cup.portal.com) writes:

>If any of you have seen the Jawbreaker version that has a plain rectangular
>maze, what you've seen was the court 'prop' that I used to show a game in
>between Head-On and Pac-Man. It was never supposed to be shipped, and it
>was an accident that it got out. The third Jawbreaker maze was an attempt
>to cover that up, since On-Line had already announced the new version with
>the dual tunnels. Oh well...

I've always been somewhat mystified by the various descriptions of Jaw-
breaker, Jawbreaker II, and whatnot, since they never seemed to jibe with
my experience of the game(s) which went by those names on various (let's
face it, pirated) disks I inherited in the process of buying up some
other folks' used Atari systems.

The first "Jawbreaker" game -I- saw, consists of five big horizontal "runs"
separated by walls in which there's a single gap which moves rapidly back
and forth. Four of the five "runs" are occupied by large PMG "smiley faces,"
each a different color, moving back and forth, and each rotating in a dif-
ferent manner (a nice touch,hat I've always thought). The player controls
a movable, continuously-chomping set of teeth that can move horizontally
in the "runs," and vertically from one "run" to another through the gap-in-
the-wall when it goes by. The smileys can travel off the edge of the
screen, but the teeth can't. This sounds almost like the "plain rec-
tangular maze" you may be describing, John, but IS it really? The credits
also say "by Chuckles," is that a pseudonym of yours, or is it someone
else? For what it's worth, this game has never struck me as being par-
ticularly reminiscent of PAC-MAN, and I've always thought Atari should've
gone right to the ultimate judge of game similarity: the people who PLAY
'em. After all, it has always seemed to me that the people who play
the games are VERY sensitive to the similarities and differences between
games which, to the uninitiated, may "look" different or the same re-
spectively. I'd expect a corporate lawyer to be VERY out of touch with
this sort of thing.

The game I know as "Jawbreaker II" on the other hand, is VERY reminis-
cent of PAC-MAN, I'm sorry to say, although JB2's graphics appear to be
somewhat higher-resolution than PAC-MAN's (all of this on the 800 and
800XL, BTW, not, say, the 2600 et al). I'm not all that "hip" to the
details of the individual mazes or levels on PAC-MAN _or_ any game like
it, though, so can't comment on which set of mazes THIS game has.

Also I'm a bit fuzzy still on the exact effect on the public of your
legal confrontation with Atari. I will say that I still remember being
TOTALLY BLOWN AWAY by the PAC-MAN cartridge for the 800, in that it was
far and away superior to the several TRULY LAME versions I'd seen for

the 2600. Looked just like the arcade console as far as I was concerned. I was, and still am, mightily impressed. Can I assume THAT was yours, John? I still can't get beyond about the fourth or fifth maze, even after all these years... :-)

'Tis really great to have you here to reminisce and talk with, John. Hope you hang in here for a good long time. (On a related note, what ever became of Phillip Price, music programmer, who stuck his head in here for a few weeks last winter and then disappeared? I thought he was going to share Antic Music Processor code with us?)

Yes, it is mirrored at wuarchive.wustl.edu in, I believe,
mirror/archive.umich or something like that. Mirror sites are also located at
src.doc.ic.ac.uk and archie.au (the Australian archie site). I can't remember
the directories offhand though...

Well, I still haven't been able to get Kermit65, my P:R:Connection and
2400 bps modem to cooperate. But on the other hand, I have been able to do
Kermit file transfers at 2400 with Omnicom. I've had Omnicom for a while and
forgot about its ability to do Kermit file transfers. So now I can use it, but
I miss Kermit65's flexibility, at least at being able to configure the different
parameters. But, Omnicom will do for now. Whew, not a hardware problem...

Everyone that gave me advise or offered me the tape player/recorder, thanks. And for the tape deck - I got a deal from a local, so all is cool; thanks guys/gals who offered me.

Oh, is it just rumor (I haven't been on this news group too long) or is the 800XL a "problem child" with quality? Mine seem to work, then didn't. I guess it was DOA when I got it from a 'junk' store - one plus is that I got a BASIC cartridge (replacing the one I lost for the 400).

Anyways, thanks for the help!

I'd say you have Jawbreaker II and Jawbreaker mixed up. When my dad got
our 800 my Junior year of high school, I remember driving my moped 20 miles
in 20 degree (Farenheit, not Celsius, this clarification brought about
for those people who live in enlightned, Metric countries:-) weather to buy
a copy of the orignial Jawbreaker. This was followed by MANY months of
entertainment inside a _WARM_ house. :-) It was very much like pac man.

Jawbreaker II is the 5 horizontal rows game. I never played it much.

Since Atari made pac man, and John was in a legal battle with them, I'd
say he didn't do pac man. It is an almost exact duplicate clone of the
arcade game, though. However, I think I like Jawbreaker better, because it
moves faster in the earlier levels, and the goons are smarter.

2573. 1040 question

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-21 13:44:18 UTC
From: manf5853@audi.gmi.edu
Message-ID: <manf5853.743262258@audi>
Source record: 105931

I recently unpacked my old Atari 1200XL and 1050 disk drive. Much
to my amazement, about 1/2 of my old disks still worked. I was
quite impressed, since I'd basically tossed the disks in a drawer
and forgot about them. Realizing that the disks that still worked
probably don't have much life on them, I bought some brand new floppies
to transfer the files onto. Only I have one problem. My 1050 doesn't
seem to want to format these disks. Upon further analysis, I've
discovered that I can read from my disks easily, but any attemp
t to write to them usually gives me one of several errors.

Does anyone know why this is or what I can do to fix it, short of
buying a new drive???

Any input would be greatly appreciated,
John

2574. Anyone have an old 800/800XL/1200XL to unload?

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-21 14:58:17 UTC
From: J056600@LMSC5.IS.LMSC.LOCKHEED.COM

Source record: 105932

I'll admit it. I'm feeling *very* nostalgic.

I wish I never sold my old Atari system.

I'm remembering all the times my brothers and I got together a few years back and played all those old Atari games...while the graphics were crude by today's standards, they were very good at the time and remain very playable even to this day. I still have a few of those games, and I'd love to play them again...

Does anyone here have (or know a source for) an old Atari system, including disk drive and power supply, and all necessary cables? I'm looking for either an 800, 800XL or 1200XL plus an 810, 850 or 1050 disk drive (I think those are the right numbers). I'm not sure what these things are selling for these days, though I'd think $100 would be about right. I'd prefer to deal with someone local to the San Jose area, so I wouldn't have to deal with shipping and all that, but that's not an absolute necessity.

As someone who hasn't played M.U.L.E. in years, and misses the cool music in Ultima III, I'm counting on you...

Tim Irvin

I've heard lots of bad things about the 800XL. I personally had a 1200XL between 1983 and 1985; I never had a single problem with it. I've had no experience with the 800XL. My brother had an 800 which he sold a few years back (so I can't buy it back from him :( ).

Since I'm in the market for another old Atari 8-bit system, I do have a few questions (I'm new here, so if it's on the FAQ, my humble apologies). What's the difference between the 800 and the 800XL? Between the 800XL and the 1200XL? If I remember correctly, the 800 has 48K while the XL series has 64K. What other differences are there?

Second question: disk drives. There's an 810, an 850 and a 1050; that much I know. The 810s are the old ones--that much I know as well. What other differences are there? Do some have larger capacities than others? Are some faster than others? I'd like to make an informed buying decision, and it's been years since I've dabbled in Atari hardware. Thanks for the help!

Again, I apologize if this stuff is in the FAQ.

Yep, do you know the TV series called "Magnum" (at least it's called this
way in Germany) ? In one of the 1986-1988 episodes, an ATARI 400 played
quite a significant role.

You know, there was a little guy in a hospital with his 400 Classic Atari
who helped Thomas Magnum to login on a companie's computer.
Apparently the screen showing the logon message was faked i.e. definitely
not of the Atari. You can see this phenomena quite often in movies;
someone is hacking on a particular computer's keyboard while what you can see
on the screen in no way resambles what the real computer can generate.

Anyway, the guy in the hospital plays also several games on his 400.
One of them is Defender.

What I was amazed about on that episode was the strange keyboard on the
400. It looked like an add on keyboard placed on the top of the original one.
Was this made for this TV series only, or do those add-ons really exist?

John,

I've had similar problems with my 1050 several times. You have to know that
my 1050 stays in a rather "dusty" room. Therefore once in a while the
the whole where the write-protect-sensor is located get filles with dust.
I guess you have the same problem with your 1050 as, like you said, you haven't
used it for a while.

All you have to do is to disassemble the case carefully. When you look at
the drive from above (the way you usually look at it) you'll discover the
sensor at the lower left. It's fixes with a Philips (sp?) screw.
Now remove the screw and the sensor carefully and remove all dust from
the whole. Be sure to remove all dust from the deeper part of the whole as well.

That's it. Now put all the things together in reverse order and your
1050 should be able to format and to write disks again.

Hope (no, I'm sure) it helps.

Yes, Atari did do the "fake" superman game. I remember reading in
Eletronic Games how they spent months on the 60 seconds on the screen
project. They wanted to have something that videogames of the 21st century
would look like. (little did they know that in little than 3 years, there
were game systems and computer that put that scene to shame.)

There are quite a few useful programs at the Atari archive, but
it's too bad the files 8-bit.cat and 8-bit.text are so out-of-date.
It's not always obvious by the title what the program is all about.
Maybe someone out there would volunteer to update these files?

> CONTROL-S / CONTROL-Q. Not very classy, but it gets the job done.
>
>

Well... it's not TOTALLY the 1.79 mhz that keeps it slow. Ever use Hyper
E:? It's a replacement for the OS E:ditor handler. It runs about 200%
as fast (the one I have has an [ESC] bug tho!! ...)^;). Anyways...

OH HEY! Isn't the 400/800 OS E:ditor slower than the XL/XE? It seems
like it, to me...??? hmmmm!

As for [^1] ... well, the set of [1] -> [3] [CONTROL] key combinations is
actually QUITE classy, I think. The normal [CONTROL] characters are
VISIBLE, and have ASCII/ATASCII values. This, to me, is a WAY better way
of doing it than how IBMs do it. (I've seen HEX-editors on IBMs. They
show Decimal/Hex/ASCII representations of the bytes. It's crap, though,
because only about 30-40% of the 256 byte values are actually VISIBLE.. o
so you end up with a bunch of little "." like dots instead of the nifty
inverse and [control] characters you would on the Atari's...)

As for those who don't know (I wouldn't be too surprised.. it doesn't
seem the most obviously documented (I know.. I know.. exaggeration) set
of keystrokes), the [^1-3] commands are:

[^1] - pause OS editor display. Including OS PRINT/PLOT/DRAWTO/Fill(?)
Notice on TurboBASIC that TEXT and CIRCLE and PAINT (?) are not
effected by [^1]. As are many "dumped to screen"/"page flipped"/
"scrolled"/etc. ways of putting stuff onto the screen.. So only
"standard" ways of doing it (send to E:ditor) are paused.
[^2] - buzzer. This is a valid ATASCII character, though.
[^3] - EOF. (end of file) This is the E:ditor's version of reaching the
end of a file (like you would with the D:isk drives, C:assettes,
etc.). Unfortunately, with the E:ditor (I guess vs. the K:eyboard
????), you MUST hit [RETURN] at the end of your last typed line
otherwise it will be ignored. (You can go back and edit the
current line and all that crap, though, which is what's good about
doing things like [C]opy E:ditor,file/printer INSTEAD of copying
K:eyboard,file/printer... also, with E:ditor, you can see the
stuff you type (the INPUT command sort of just copies E:ditor to
a place in RAM (string, variable, etc.)

Very cool OS these puppies have, eh?

COOL! I want PaperClip! :) Does it have spellcheck, etc.? (I suppose
I could flip through my dozens of catalogs to find out all about it, but
still, they wouldnt inform me of any quirks or annoyances with it)

Is it DOS dependant (ie, BOOT or die, rather than boot your DOS, then
[L]oad it or .EXEcute it?)

I'd say the UART approach will work best.
You may be able to simplify things by using 2-4 joystick ports as the lines.
It is also possible to do stuff by adding another PIA chip, Jeff McWilliams could tell you about that kind of thing.
The SIO would work okay too, but the 800 does have the 4 joystick ports.
A PBI device is not needed since 9600 is well within SIO speed abilities.
And it is non-text so no screen handler junk to worry about.
Free up your cycles, it is the only way to allow you the freedom to add the features you want.
With a "slow" machine, it is much better to do stuff in hardware whenever possible.

Scott Maxwell (scottm@cup.portal.com) writes:

>Does the 850 need a disk based driver or is it in the interface's ROM?

Sort of both, actually. The original support for the 850, from Atari, consisted of a little 6-sector AUTORUN.SYS file (for Atari DOS 2.0) which at boot time issued a couple of undocumented SIO commands to the 850, causing the 850 to respond with the actual hardware-initialization code, handler, etc. As I recall, the first undocumented command caused the 850 to return a packet which then became the command issued to the 850, causing the "real" R: device handler to load and initialize.

>Giving manuals away? Give me details...

Quoted straight from the flyer:

FREE ATARI 8-BIT AND ST MANUALS

During our spring cleaning we found hundreds of extra manuals for our
old Atari 8-bit products as well as a few for our Atari ST products.
Instead of selling them individually we decided to pack them in a bundle
and give them to you for free! A bundle usually has 5 to 7different
titles and includes at least four of the following: SpartaDOS X,
SpartaDOS Construction Set, MAC/65, Action1, BASIC XE, and Personal
Pascal version 2 (Atari ST). There is a catch of course! Because it is
a lot of paper, you have to pay for the shipping! So hurry up, it may
be the last chance to fill your library.

Manual bundle ..... FREE! Shipping $13.00

Plus a $2.00 handling fee no matter how much you order.

Wanna see a WONDERFUL "use" of re-using P/M graphics, check out the Our5oft demo. This demo ALSO does that mode8/mode9/mode15 all-in-one line trick which has been talked about a lot lately, too.

The screen ends up looking like this:

area for 16 x ? x 2 player to move back/forth
area for large mapped IRG text scroller

area for:
graphics 8 graphics 9 graphics 15 (1 line!)
8 3-colored player/missles (aka 24 true PMs!!!!!!!!!)
1 double-width player

again, the last three lines all take up the SAME area of the screen. And the 24 PMs are NOT all on seperate lines... they fly around in a sort of sideways figure-eight pattern!!!!!!!!!!!!!!!!!!

Again, this is the small (20k?) Our5oft demo. Loadable from DOS, even! :)

Unfortunately, the word wrap here is less than 75 (which I set Action!'s line length to. D'OH!), so some lines need to be [s^DEL]'d together in some cases (all will be comments which fell to the next line at the space.)

This program uses the same (converted to Action! by myself) routine for generating a 2D maze as the program Hidden Maze (from Compute!'s 1st Book of Atari Games) does. Hidden Maze was by Gary Boden. I think I'll post that bit of code before I go on:

```
480 GRAPHICS 17:POKE 756,CHSET/256
490 SC=PEEK(88)+256*PEEK(89):SETCOLOR 2,0,0
500 DIM A(3):A(0)=2:A(1)=-40:A(2)=-2:A(3)=40:WL=129:HL=0:TRAP 32767
510 A=SC+21
520 FOR I=1 TO 21:?#6;"!!!!!!!!!!!!!!!!!!":NEXT I:POKE A,5
- between quotes are 19 * INVERSE * "!"'s...
530 J=INT(RND(1)*4):X=J
540 B=A+A(J)
550 IF PEEK(B)=WL THEN POKE B,J+1:POKE A+A(J)/2,HL:A=B:GOTO 530
560 J=(J+1)*(J<3):IF J<>X THEN 540
570 J=PEEK(A):POKE A,HL:IF J<5 THEN A=A-A(J-1):GOTO 530
580 RETURN

2597. Joust/Players/Our5oft/Mario Bros. for that matter

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-22 08:25:10 UTC
From: anyone@cyberden.sf.ca.us
Message-ID: <Nky37B10w165w@cyberden.sf.ca.us>
Source record: 105859

Ok... I read the post about Joust doing the funky stuff with PMG....

WELL guess what BILL just remembered!?!?!?

Look at the Joust enemies? The birds: what colors are they? Red, White, Blue. If I recall, the red was identical to other reds in the background. My best guess about Joust is that the ENEMIES were bitmapped graphics being placed onto the screen, while the PLAYERS were PMGs....

THis goes the same for Mario Bros. BOTH versions - the 82/83? version and the 88 version (I have the 88 and have played/seen the 82/83 as well). The players (Mario and Luigi) are either red (?) or green (?) with other colors for skin, etc. The background is Graphics 15 or IRG 40x24 text, AS ARE Mario and Luigi (more likely Gr.15, like Joust seems to be). The turtles, crabs, etc., all have the same colors as the background.

So THERE!

But there ARE the games and programs (like the Our5oft demo, and the Eight Player (guess what IT does!?) demo) which do TRULY use a ton of players on the screen at once. Ever play Mirax Force? It has about SIX 2 or 3- colored enemies on the screen at once.

Guess what else, though? In Mirax Force, the only thing that can move VERICALLY is the HUMAN player. The enemies come randomly in verical positions (great for messing w/ DLIs!) on the screen, but all at the same levels, and these levels do NOT overlap.

As for ZEPPLIN / COGNITO / whoever games like Zybex and Draconus, the graphics is done like THIS:

Zybex: Scrolling background bitmap (most likely 40 x 12 IRG text) and scrolling "foreground" - enemies, bullets, tokens, weapons, probably in graphics 7 160 x 96 mode.
The enemies, etc. etc., all the forground stuff, is placed onto the screen as bitmapped graphics. WHOOPS! I'm sure I'm wrong about the IRG mode. I'm sure it's 100% Graphics 7. Pause the game and look carefully. Look for an enemy who is on top of the background. It does not flicker, it is not some inbetween color. The bitmapped graphics here is probably handled SO well that when enemies/background/other enemies overlap, they are placed on the screen ONE pixel at a time!

The HUMAN players in this game consist of two 2-colored PM's...

Draconus: VERY similar to Zybex. No scrolling, though. Weapons (except one) are PMG as well (flame, animation of "grabbing").
The enemies, though, are NOT meshed onto the screen in the same way Zybex enemies are. Sure, it's 160 x 96 x 4 mode, but the enemies are sort of PAGEflipped onto the screen somehow. Very difficult to say, as I've never seen the concept in any other software, let alone written DOWN! Pause the game and look at the enemies. If they are touching background, they sort of blend in a flickery way. This game actually uses what could be considered a 160 x 96 x 16 color mode.

Of course, dont quote me as I may be totally wrong about ALL of this, but as I've played/examined all of these games (joust/mirax force/mario bros/mario bros release 2 (for XEGS)/zybex/draconus), I feel that I sort of know what's going on with them.

Well, enjoy staring at the above games (if you feel like it). You may just end up believing me! :) And then trying to code some of this yourSELF!

Oh yeah, as to why Zybex and Draconus only use 4 colors per screen (the game part, at least - ie, not including score/status/etc), instead of 8 (as in pallete colors, not combine, where you'd get 16, like in Draconus) is beyond me.

Maybe it had to do with speed???

I agree with that! I remember my first programming classes at school some years ago. We were using 4.77 MHz PCs for Turbo-Pascal programming.
Nearly every Turbo-Pascal program written at school was slower than the equivalent in Turbo-Basic XL on my 130XE at home.

2600. 400/800 Hardware+OS Manuals Needed

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-22 13:48:04 UTC
From: coleman@alexia.lis.uiuc.edu
Message-ID: <CAKJo5.19E@news.cso.uiuc.edu>
Source record: 105951

Believe it or not, I've owned various 8bits since 1982 but never got around to getting the Hardware or OS manuals. Now that I'm thinking of hacking up some neat stuff for my 800, I find I could really use the information contained therein. Anybody have copies of these manuals they'd be willing to part with? I could trade for disks, carts, or perhaps some Atari books, or I could even resort to paying for it with money (what a concept!) If you have these or anything else which might be helpful to somone wishing to construct an SIO-to-RS485 interface for an 800, please email me.

Thanks!

As a separate newsgroup, it came into existance when they separated the ST
group out. That was in 1985 I'm pretty sure. I have some printouts going
back that far. Before that it was just C.S.A and goes back into the early
80's I know for sure.

I was looking at some of my old printouts and waxing nostalgic over some
of the old names that used to post regularly. Chris Chiesa goes back a
long way. I saw one of his posts from the mid 80's time frame.
Having a hard time typing, my eyes are all misty. :-)

2602. POKEY Sound

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-22 15:31:45 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9307221502.AA20194@smithkline.com>
Source record: 105868

Like Jeff Potter I too thought I'd missed something at the mention in a previous post of POKEY's supposed "true sine wave sound".

In the course of intalling/testing/correcting the GUMBY presentation in Current Notes (April? or May? 1991, I forget exactly), I recall checking actual music output waveforms with my oscilloscope. Squarewaves.

Further, even using the "volume only" mode Jeff refers to, the sound quality just does NOT approach natural analog sound. Virtually every sound I've ever heard from my 800XL has the raspy, gravelly texture characteristic of complex squarewaves. Pure squarewave tones, in addition to the above characteristics, also have a peculiar "hollow" characteristic most frequently associated by the tone-deaf public with "videogame arcade sound".

One of the many projects I had planned for my machine before I got sucked into the publising business in 1989, was a circuit I had designed to convert squarewaves to sinewaves via an op-amp controlled resistor-diode waveshaping circuit I conjured up. This one was fairly elaborate, yielding sinewave distortion values of 0.5% or less, which is extremely good for this type audio circuit. Took a lotta parts, tho. 12 diodes, a ton of resistors with weird values. I was in the process of evaluating different op-amps (I wanted to use the TL072 on account of its low noise & good TIM characteristics) when the fire brought all my hardware projects to a sudden conclusion.

BTW, I spent 7 years publishing articles in audio electronics/psychoacoustics before I got into this bizarre AC business.

I thought the funniest part of Airplane II was when the Shuttle
started undergoing some havoc. They had a shot of the cockpit and
all hell had broken loose accompanied by the characteristic beeping
of an Atari disk drive loading data and switching tracks.

Im not sure what use this will be to you, but I beleive there is a
disk based version of the 800/XL/XE OS hardware manual on the ftp site.
(Atari.archive.umich.edu) I have it stored on a 360k XF551 Disk, and I
believe it has roughly 120K free. I hardly use it though, as most of
the info I already know. I guess thats what happens when you've been
programming on the 8bits since 1984. (back in elementary school days)
Im now a Junior at Kent State Univeristy and double majoring in
Computer Science (Programming) and Applied Mathematics. Now, about the
only thing which I use, on the rare occasion that I forget which location
it is Im thinking of, is the Mapping the Atari XL revision. Or possibly
just flip through my own programming notebook.

I hope this helps.

> area for:
> graphics 8 graphics 9 graphics 15 (1 line!)
> 8 3-colored player/missles (aka 24 true PMs!!!!!!!!!)
> 1 double-width player

A question about the Player/Missles graphics thing, does each PM Graphic shape have 3 different colors on 1 scan line or is it a different color on each scan line? If its the later it could easily be using MultiColored PM_Graphics.
Antic ran an article on this back in 1986 I believe. If I remember correctly it merely `slaves` the antic during the the display area to handle the color aspect of the P/Ms. The article talks about the technique as well as provide a nifty Mac/65 source code Demo program using this to bounce 4 PMs each having about 8 colors (1 color per line) in different directions inside this imaginary box.
It is listed in the February 1986 (Volumne 4, Number 10) ANTIC issue.

I would personally like to see the Synapse stuff and the unreleased games, sure.
I think the TURBOFILE discussion quelched any talk even remotely close to what might be construed as "piracy".
But I think most 8-bitters would like to see this stuff.
John, your presence on comp.sys has really been a pick-me-up.
There is nothing better than having a programmer around who could work on a
any machine in the world, and still likes to program on the 8-bit.

Hi Chris,

>I've always been somewhat mystified by the various descriptions of Jaw-
>breaker, Jawbreaker II, and whatnot...

Yes, you have Jawbreaker and JB II backwards. The one with the five rows, (which is JB II), was supposed to be a copy of my 2600 version of JB. It's similar, except it was supposed to have about 10 rows, and the there are supposed to be fixed vertical passages at the ends of the corridors that the teeth can travel up and down in addition to the moving 'doors'. The reason it came out the way it did, was because Ken Williams just grabbed a piece of paper, drew some lines and circles on it, handed it to Chuckles, and said, "Do this." Since there were only five lines in his drawing, that's how many Chuckles put into the game. Ken never drew the verticle passages, and Chuckles didn't know they were supposed to be there. IMO, JB II on the computers lost most of the game play enjoyment in this transition.

As far as Atari and Pac-Man, I actually did write Pac-Man first. On-Line was selling an Apple II program called Gobbler that was a blatent Pac-Man rip-off. Being 19 years old, I didn't even know there was anything wrong with doing that, and so I did too. By the time I showed the game to Ken, Atari had contacted him about copyright infringment of Gobbler, and that he must pull the game off the market. Ken told me he couldn't sell my prgram either, and that we'd have t disguise the game a bit. I returned the next day with a game that had mustaches and sunglasses on all the ghosts. :-) Outside of generating a lot of fun, it was of course, not what he had in mind. (BTW, two of these 'ghosts' are used in Mousekattack -- I couldn't resist, even though they don't look like plumbers.) Jawbreaker was born shortly thereafter, however, a 'hybrid' version that had the happy faces, but still had the old Pac-Man blinking dots escaped and made its way through the grapevine. It ultimately wound up at Atari, after which we received a phone call from them. Jawbreaker had just started shipping. Atari said they saw what we had done, and in their opinion it was still the same game, and they still would not allow it to remain on the market. They gave us a choice. They offered to buy my original Pac-Man game, that they would sell, and pay us $4 a cartridge for it. We could still sell Jawbreaker up until their game was ready to ship, at which point we had to pull Jawbreaker off the market. Ken said this was an excellent deal, since the life of computer games was short anyway, and so we agreed. Ken went to Atari to sign the paperwork. By the time he got there, Atari changed their offer to .75 cents a cart, and told us, "You have until 5PM tonight to take Jawbreaker off the market, or be sued." Needless to say, Ken was rather upset, told them to uh... well... I'll just skip this part. :-) They took us to court, and could not prove infringement, so JB remained on the market. It was at this time that the switch to our 'court prop' game was

somehow made, and ran undiscovered for a bit. This maze has rectangular passages -- not the horizontal ones of JB II. The enemies come out of their box, hit the first rectangular passage, and go round and round for a bit. It's a real shame, but like I said before, it was never intended to be played.

I still have a finished, working Pac-Man game. Sadly, I only have one copy and the disk that it's on has a bent/crushed section and won't read. Does anyone have any experiances with reading damaged media? Is there any way to straighten the media back out? I played briefly with pressing down lightly on the head, and actually got part of it to read in. Someday, I may be able to get the rest of it, or the sections of source that would let me rebuild that part.

>ing here, that it completely escaped me that you offered to share your
>partially-completed games with us! I'd like to see 'em, myself, and dare
>I presume to have any kind of skill worthy of adding code to them?

All these old war stories have gotten me excited about the 8-bit machines again and I've even bought some new equipment to replace the fading 800 I've used off and on for the past few years. My system is still a bit incomplete, so even getting software from the net *to* my XL might be difficult for a while (there's got to a be a better way than Usenet --> Sun --> PC (via SIO2PC) --> Atari).

But I most definitely would like to see those games. I would have commented further on some of the other subjects that have apparently been mentioned, but the most recent posting I have received is dated July 8. Sigh.

What's nice about the re-emergence of John Harris that's different
from the other celebrities that have dropped in from time to time,
is that he still *uses* the 8-bit machines. Mr. Price reminisced
about old times, but his current interests definitely lie elsewhere.

[I didn't received any c.s.a.8 postings from July 8 - July 22.
Pardon if I repeat subjects which have been thoroughly hashed out.]

Source record: 105884

I did a nifty trick with the last version of PaperClip using my 320XE and one meg MIO. For those of you who don't know, PaperClip uses a built-in proprietary DOS.

I kept one ramdisk on the MIO the same size as a 1050 density floppy. I kept a disk image of PaperClip on my hard drive.

Since I was running SDX, I wrote a batch file that expanded the disk image to the MIO ramdisk, swapped the ramdisk to D1: and rebooted the system.

It took only a few seconds to be up and running in PaperClip. Then because I had more than 128K, the first time I accessed the dictionary it was loaded in the banks above the standard 128K. From then on, spell checks ran at RAM speed.

TextPro running off my hard drive under SDX handled most of my word processing needs, but other than the #$%&@! proprietary DOS that didn't recognize my Sparta format hard drive, I preferred PaperClip.

2614. ATR8000 and stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-23 17:10:27 UTC
From: svh@verdix.com
Message-ID: <svh.743447427@sarge>
Source record: 105874

I have the following items for sale:

ATR8000 with 64K Z80, 256K 8088 coprocessor (yes, it will run PC-DOS or MS-DOS) with RT clock- $150. I moved this to a larger case to give the RT clock a little breathing room, and will include the original beige case.

DSDD 8" floppy (Qume) - working. with spacious case + p/s $25

2 ATR8500 - this one never made it to market - but it was a redesigned ATR8000, smaller, cleaner, real SIO's instead of the bit-banging the ATR8000 used. One is working, the other partially assembled and not quite there yet.

$50 for the working ATR8500, $25 for the non-working one.

I'll include all tech specs, schematics.

(For those that don't remember the ATR8000 series , they were expansion boxes that could run CP/M using the Atari 800 as a terminal, or provide RS232 serial port, parallel port and disk drive interface (using standard disk drives) to the Atari.)

2615. ??? Using ST Drives On 8-Bit Computers ???

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-23 17:45:29 UTC
From: totty@flute.cs.uiuc.edu
Message-ID: <CAMpBu.L3v@cs.uiuc.edu>
Source record: 105873
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Has anyone tried to rig up the software & hardware necessary to use ST floppy drives on the Atari 8 bit computers? It would be great to be able to use the extra disk storage, and it would be ideal if the file systems were compatible, so we could share files between the machines.

So, has anyone done this?

I don't have time to hack on this project now, but might look into it in a few months. Any particular trouble points to watch out for?

Here's a silly little question.

Is there a common description of the set {400,800,1200,XLs,XEs,...} which is more concise than "Atari 8-bit Computers"? For the ST variants, you can just say ST (meaning any member). Since the Atari 6502 machines are largely compatible, it would be nice to say X, like "this program runs on any X", without X being as verbose as "Atari 8-bit computer".

Any advice on this pressing problem? :-)

All this Atari nostalgia recently, and the appearance of John Harris in our group, makes be wistful for those halcyon days of the early 80's.

In order to remind me of the good-ole-days, and to avoid work, I'm making a "My Favorite Programs" list.

I'll include some of my favorites below. I'm going to ask my brother to remind me of some other classics, asnd add them later. (I'm sure I'll get some of the titles wrong). If other people are interested, email me your favorites, and I'll add them to the list, and will post the list periodically. If there isn't interest, please be patient during this passing sentimentality...

2619. Getaway

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-23 18:45:07 UTC
From: bantolph@draco.unm.edu
Message-ID: <22pbjjINNcjj@lynx.unm.edu>
Source record: 105877

Recently a friend of mine from high school came down from Idaho. When we get together we always break out the old Atari and play the video games of our your fuiously.

To get to the point, I have this game called Getaway. Real cool game in which you have to find treasures, rob armoured cars and get away from the cops. I kicked his ass in that game completely but he argued that my high score was not valid because Getaway is a Public Domain game. I was always under the impression that it was commercial software. Yeah, if it is commerical I am a bad guy pirate, I know.

Can anyone clear up this question for me.

Thanks.

Hello all,

Sorry for the delinquency on my part about delivering this
information, but my memory always seems to dull in the summer months....

Atari Personal Computer Systems
A Warner Communications Company

Suggested Retail Price List
Effective May 1, 1981
(Supercedes Jan. 1, 1981 Price list)
(duh)

Base Units
Atari 400 "The Basic Computer" (16K RAM)..............$ 399.00
Atari 800 "Personal Computer System" (with 16K ram)....$1080.00

Peripherals
410 Program recorder..................................$ 89.95
810 disk drive........................................$ 599.95
815 dual disk drive (double density)...................$1499.95
(WOW!!!)
820 40-column printer (impact)........................$ 299.95
830 MODEM.............................................$ 199.95
850 INTERFACE.........................................$ 219.95

ACCESSORIES
16K RAM...............................................$ 99.95
810 MASTER DISKETTE...................................$ 25.00
810 BLANK DISKETTES (5 PER BOX).......................$ 25.00
810/815 BLANK DISKETTES (5/BOX, CERTIFIED FOR DD)......$ 32.95

ENTERTAINMENT
ASTEROIDS.............................................$ 39.95
MISSILE COMMAND.......................................$ 39.95
STAR RAIDERS..........................................$ 39.95
Special Price --Star Raiders
Effective through Sept. 1, 1981

Programming Languages and Aids
Assembler editor......................................$ 59.95
Atari Basic...........................................$ 59.95
Microsoft Basic (1 cart, 1 tape)......................$ 89.95
PILOT (with "Turtle Graphics").......................$ 89.95

This is just an excerpt of some of the more popular items.
Just a reminder, all games listed here were in cartridge form,
```

as were all languages (except where noted).

Comments:
90 Bucks for PILOT!!!!!!!
100 Bucks for 16K
Whew!! and I thought $30 was a lot to pay for 1 MEG!!!
$25 for 5 disks!!!! Unreal....
and an additional $8 for DD disks! My head is spinning...

Hope everyone enjoys this posting, I can always add more if people want me to. The flier is three pages entirely filled with Atari hardware, software, and combo packages.

Getaway was one of many titles marketed by the defunct Atari Program
eXchange (APX). Back in the early days, end users could submit their
programs to APX and if your program was selected, they would include it
in their catalog and you would get some share of the royalties. APX
also ran a contest or two with cash prizes for the best programs. As
I remember, APX was disbanded when Jack Tramiel took over Atari.
The $64,000 question is--were these programs released to the public
domain when APX folded? I don't know, but suspect not. B&C
Computervisions's latest catalog lists approximately 200 of the old
APX titles still for sale (Getaway included).

Something similar happened to me once. I went swimming and left a stack of
unevenly piled disks on a hot table. By the time I got out of the pool, the
side of the top disk (with the only copy of my latest project -- heh) had
melted slightly, bending over the disks beneath it.
I ended up writing a program that would read the raw sector data
over and over and over and over and over until I was lucky enough to get
a good read. As I got closer and closer to the melted section, the reads
took longer and longer (and I had to pop the top of the drive and start
pushing on the head with my finger), but I eventually got a working copy
of the source back. I don't know how something like a brute force method
would work on bent disks, but it's worth a shot.
Also, if the disk's from a name manufacturer, they used to be
willing to do all sorts of low-level magentic reads for a fee. I don't
know how will they'd be to work on Atari 8-bit stuff anymore, but it's
worth a shot.

>... The 8-bit would probably be even more difficult to emulate.

Hardly! Emulating the Atari XE on the PC is much easier than on the ST because of the faster speed of the PC, the fact that both the 6502 and x86 chips are little endian (thus you don't have to swap bytes all the time like on the ST version), you have graphics capable of actually emulating all Atari 8-bit video modes (the Atari ST CAN'T!), and you can even read Atari DD disks on the PC directly. I have the Atari emulator running on the 486 at over 5 times the speed of a real Atari 8-bit.

By the way, several Apple II emulators for the PC have been available for years with similar performance.

I showed the Atari 8-bit emulator for the PC at several Atari shows over the last 2 years but not too many people seemed interested in such a product so it shall probably remain unreleased. For now if you do want to run Atari 8-bit software on the PC, you can do so by running ST Xformer on Gemulator. The new Gemulator 3.0 coming out in a few months has a new version of ST Xformer bundled with it.

Just made an 8-bit sighting in the 1982 movie "Time Walker" (under the title "Being From Another Planet" on MST3K).

Someone was loading a graphics screen beep-beep-beep-beep-beep.. and then some alarm screens with big GRAPHICS 1 lettering. And then you have a side view of the 800.

>I think Atari sold the rights to the APX programs to Antic Magazine.
>I don't know what happened to them after Antic went under.

Antic bought just a few of the most popular APX games.

Just take a look at the B&C ComputerVisions catalog. They list all the
Antic titles, many recognizable as former APX titles, and they also list a
huge selection of titles that remained under the APX label.

]Any advice on this pressing problem? :-)

What I've occasionally heard used is $ Atari, as in "2 bits, 4 bits, 6 bits, a dollar". It's typed as a single character and said as one word, which is an improvement over "8-bit". I've been surprised not to see it used here on usenet.

John,

Did you try the trick of taking a new disk, slitting the black plastic
along one side, removing the media, doing the same to the damaged one,
and placing it in the new black envelope?

Then I would try a low level, sector by sector, copy to a new disk
before doing anything else to the original, with a routine that would
skip past the bad sectors.

This copy you should be able to reconstruct at least source files
from, by pulling individual sectors one at a time.

If the media is physically _dimpled_, AFTER copying as above, and
I would definitely experiment on a scrap disk first, perhaps an iron
on _low_ heat, making sure it had a non-magnetic metal surface, and
unplugging it after letting it warm and before using it on the disk.
I HAVE NEVER DONE THIS! EXPERIMENT FIRST WITH A SCRAP DISK! AND
copy whatever you can first (sector by sector to skip by the bad stuff).
But it might help. Good luck!

Oh Yes, and cover the disk with paper to keep from scratching it if
you try ironing it.

Yes, there were a few replacment keyboards marketed (not anymore that i know of)
that were full stroke (800xl type) keyboards... I actually have a 400
w/ one in it... I like its keyboard much better than my 130xe...

2639. What's up with LotsaBytes?

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-24 20:51:35 UTC
From: exuhag@exu.ericsson.se
Message-ID: <1993Jul24.205135.10515@exu.ericsson.se>
Source record: 105900

I'm afraid I'm going to open a big can of worms with this post, but
here goes anyway.

I'm in the process of getting a usable 8-bit system together and have
requested information from quite a few companies on Michael Current's
Atari vendor list. I've been planning on sending an order to B+C
Computervisions, American Technavision, or More Than Games, or maybe
a couple of those places. Then I received the LotsaBytes "public
domain" catalog (their address is in the vendor list).

Has LotsaBytes *really* obtained permission to sell copies (i.e. not
originals) of just about every Atari 8-bit program ever released? I
remember LotsaBytes advertising in Analog years ago so I assume they are
a reputable outfit. Their current catalog lists everything from Mac/65
(disk version), The First XLent Word Processor, cartridge games
transferred to disk, the entire APX line, just about every utility and
game ever made, and some disks containing more than one program (e.g.
"Pro Pack #9" contains B/Graph and Atariwriter, among others). I couldn't
think of any titles that they didn't stock. And every page is headed
"PD 8BIT SOFTWARE".

Quoting the introduction to their catalog:

"All software including Public Domain (PD) will be _on disk_
as reproductions and/or distillations of the originals."

"_Notice:_
Please buy the original software if you find it somewhere."

Their prices are very low, only $1 or $2 per disk. Needless to
say, this severely undercuts the prices of the vendors I previously
mentioned. Oh, and most programs do not include documentation (the
few that do come with "disk docs, mostly short").

So what's the scoop?

I think it's absolutely clear that LotsaBytes is selling pirated software.
I am sorry I had it in the Vendor/Developer list; if I had known the nature
of their business I never would have added it. It will be immediately
removed from my list. (I've quietly deleted two other vendors blatantly
selling commercial software as PD since I started maintaining the list this
spring.)

>latest _A@_ as a matter of fa<t!))

Since Paperclip doesn't run from DOS (my biggest problem with it), you
can't use an internal ramdisk with it. By "transparent" I mean that
you don't notice or have to worry about the bank switching; the
program takes care of it automatically.
In AW+, you must manually switch banks, although the program makes it
easy to write a document that runs through more than one bank.
TextPro Xcompletely separates the banks, so you have a totally
different writing space for each bank (including main).
If you WANT separate "writing space" in PaperClip, you can always
open a second text window (just like Action).

Now if only I could get a version of PaperClip that used the
XEP80.....

(I'd even be happy with AW80, but I hate TurboWord 80!)

I have a PILL Cartridge. It basically allows you to run PILL programs
by telling the computer that the code came from the cartridge slot.
I don't think it does anything funny with the disk drive, though I have
never copied a cartridge. I only ran PILL programs. I will have to check
my documentation for more details.

AAAAARRRGH! DON'T DO THIS! Irons are heated by running the AC current
through coils embedded in the iron's surface. What you will very
likely find you have is a heated disk eraser!

Thinking over what _I_ would do here, it bother me to think
of _rubbing_ anything against the media, even if it is protected
by paper. I tend to be a clutz at times. I also happen to have
some large clay tiles in my oven. I would probablly heat those
on low heat, then place the disk between them and paper to protect
the surface, allowing the heat to penetrate for a longer period of
time, probably leaving it in the still warm but off oven overnight.
Mostly cause I would be afraid of putting a new crease in it with
my clutzyness.

Bottom line is, copy what you can first, then experiment on a blank
floppy second, as my original post said.

Atari 2600 system and items for sale:
The following items will be sold to best offer (hopefully within a couple of days; reasonable/good offers will be accepted immediately without delay).
You can buy only the items you want, or the whole package- it is up to you.
I am perfectly willing to sell separately.

Everything is tested and is in good, working condition.
==========
List of items:

Atari 2600 in excellent condition, with manual (I even still have the original box for the machine somewhere here).

Black hard plastic protective hood that goes on top of the Atari 2600, with a place to put the cartridges and manuals on the top of it; it also allows joysticks and power supply cable to be connected, so the whole system can be conveniently operated with it

Atari joysticks

Atari paddles

Official Atari Log Book (like new)

A series of Atari catalogs from different dates.

A storage box for 24 cartridges (Atari 2600/5200/7800) or cassettes or even 8-track casettes if the need arises. Wooden base, smoked clear hard-plastic top, blue velvet-like inside.

CARTRIDGES-
Frogger
Home Run
Video Pinball
Astroblast
Outlaw
Super Challenge Baseball
Grand Prix
Moon Patrol
Space Invaders
Combat
Donkey Kong
Missile Command
River Raid
Atlantis
Fishing derby

Breakout
Super Breakout
Indy 500
Astroids
Pac Man
Freeway
Skiing
Football CX-2625
Target Fun 27 TeleGames
Pong/Sports 50 TeleGames

Please e-mail offers to address COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973 late evenings in case you have no e-mail access.
Thanks!

Er, there is no moderator of the comp.sys.atari.8bit/Info-Atari8 Digest discussion group. But I'll take a stab at answering your question.

In general, buying and selling of products among individuals in entirely permissible in a group such as this. The posting of commercial product announcements is also permissible as long as it is not done "in excess," which is to be interpreted by the users of the group.

There are separate newsgroups specifically designated for commercial purposes, though I don't know off hand what they are.

Hope that helps,

I'm interested in getting an 8-bit to add to my collection...earlier today
I saw the following.

600XL - $15
130XE - $25

Neither had a drive... Can the 130xe use 400/800 carts?? Were all 8bit
carts compatible?? There was a 130xe Rescue on Fractalus carts with the
130xe. Should I wait for better deals? Thanks alot!!

Not entirely true. A few older carts won't work on the XL/XE
models (Gorf, Deluxe Invaders, Demon Attack, Atlantis) without
a translator.

More specifically, a translator that works with carts. UltraFix
can handle this.

Since it's fixable, sure, get a 130XE. It has 128K (most 600XLs
have only 16K, some were refitted with 64K) and a video port.

Some XE Game System carts, while compatible with XL/XE models,
will not work on the 400/800 (1200XL?) models. (Ace of Aces and
Dark Chambers I've tried.. no go.)

They did some tests once upon a time, putting disks in weird places (on top of the washing machine, under a tube train, by some high-tension power lines etc.) Apparently the only one to get really screwed up was the one sat under the telephone. (Perhaps because of the d.c. voltage?) Amazing considering how fragile you'd think they were after reading the label.

Anyone remember when CD's first came out and they were demonstrating them on t.v. after spreading honey, jam etc. all over them? Nowadays you're told they don't even last ten years if kept mint - apparently the lasers fade them or something!!!!

Simon "Tech is my middle name" Trew.

Actually, a few carts don't work with the XE. The only one
that comes to mind is Gorf, though. Missile Command works, but you
can't select levels (guess Atari broke their own programming rules).
Probably all of those right-slot only carts don't work also (no
great loss).

JH> rectangular maze, eating dots, being chased by computer controlled
JH> enemies. It's really pretty close.

Actually, the history of maze chase games long predates "PAC-MAN".
There was a "mouse runs the maze and finds the cheeze" game written at
about the same time that "SPACEWAR!" was, as a demo at M.I.T. (I think it
ran on a TXO-1 ??? There was a mention of it in an article about the
history of "SPACEWAR!".) An article on the history of the video game might
also mention it. Then there are the "Minotaur in the Maze" and "Monster in
the Maze" games that were being played on the PET and the NORTHSTAR five
years before PAC-MAN came out. "Monster in the Maze" had one monster/ghost
in the center of the maze that would chase you and instead of a "pill" you
would race to a "key" which would empower you to unlock a door and escape.

Most of the most popular video game "hits" were just rip-offs of
popular public domain games. "SPACE INVADERS(tm)" is just a variation of
the popular "shooting gallery" games of its time, with the "twist" that the
targets could shoot back and drop lower. "ROBOTRON 2084(tm)" is just a
version of a game called "MINEFIELD!" or "ROBOTS", except for the fact that
it is done in real time. Having an "electrified" outer perimeter is
--POINTLESS-- in a realtime game where animated enemies come at you in
realtime. It only makes sense in the "stop-action" game from which
"ROBOTRON 2084(tm)" had its origins, which was played more in the manner of
chess or "Go" than in a "blast anything that moves" arcade style. "POLE
POSITION(tm)" is a version of Road Rally and Little Red Bug and other
popular driving simulations. "PAC-MAN(tm)" is just a version of Minotaur
in The Maze. Truly original ideas were few and far between. The death of
the truly generic programmers' magazines such as "Creative Computing",
"Compute!", "BYTE" (remember when BYTE used to publish schematics and
program listings?) and truly universal source code listings, sort of put a
damper on truly original game development. "PAC-MAN(tm)" was --NOT-- an
original idea by any stretch of the imagination!

...Now about this "Great Movie Debate"...
Although it has been mentioned that "AIRPLANE!" is probably the "most famous" appearance of an ATARI video game appearing in a motion picture, many participants in this NewsGroup have mentioned previously that the "most extensive" appearance of ATARI video games in a major motion picture occurs part-way through a film entitled "CLOAK AND DAGGER". Apparently there is a scene in the movie "CLOAK AND DAGGER" in which the child star enters a computer store, only to be confronted with a solid wall of ATARI video game and computer products, running from floor to ceiling and playing on every computer console in the place. This has to be the largest appearance by ATARI in --ANY-- major motion picture. (P.S. I also understand that an ATARI acoustic coupler made a cameo appearance in the Robert Redford / Dan Ackroyd movie "Sneakers"). I haven't seen the film "CLOAK AND DAGGER", so I can not say this is true for sure, although I understand that ATARI had a merchandising tie-in to produce the "CLOAK AND DAGGER" video game.

Greetings all!

Here I am, another guy who is going to attempt to re-enter the world of the Atari 8-bit computing. I've been using the IBM's and MAC's for years now (college), and have not touched an Atari for longer.
I have an 800xl, a 130xe, a few 1050's in various states of repair, etc., and some software (mostly games) that I would hate to loose! After reading many of the threads in this newsline, I see there are many interesting new toys for the 8-bit (i.e. - Hard drives, memory expansions, program managers and operating systems, wow!)

In order to dive into this new HOBBY, I need HELP!! Would 'Atari Classics' be a benefit to a BEGINNER like myself?...Where would I get info on buying and using hard drives (to avoid the tedious disk drives)?...

I'd really appreciate the help. Feel free to e-mail me direct!

Mike Garrett
"garrett@kcgl1.eng.ohio-state.edu" (before aug. 12)
"301538@xavier.xu.edu" (after that)

Thanks again!

That's because they need a full 64K machine to run. Even 800's with
expanded memory schemes won't work because of the different way they
do things.

I do think that they will work in 1200XL machines although I can't vouch
for this personally.

I know how you feel, as I'm in the same boat. I used to use the
8-bit computers in a big way, but I've been away for a while and
all the memory upgrades, fancy DOSes, and hardware gadgets are new
to me. DEFINITELY subscribe to Atari Classics (and request all
the back issues as well). There is a lot of good and easy to
understand information in there, especially on hardware upgrades.
"The Fitting Room" column has been especially helpful.

The toughest part for me has been just figuring out what's available,
what would serve my purposes best, and where to get it. I'm taking
a conservative approach. I'm not worrying about memory or fancy
hardware upgrades yet. My first addition will be SIO2PC so I can
transfer files from my PC and use it as a mass storage device. After
that I'm going to check out MYDOS or SpartaDOS as an alternative to
DOS 2.5. Another route would be to get a Black Box, floppy board, and
mount everything in a PC case with some floppy drives and a hard
disk, but that would cost _lots_ more and take more space.

Good luck!

That's a little harsh don't you think? Maybe the concept wasn't
spontaneously formed in the designer's head when he was hit by
lightning, but it's a good balance of existing and original
ideas with a distinctive style. Good books are the same way.

James,

I'm glad you find the Fitting Room helpful. I've been sporadically including my email addresses
to solicit reader feedback and see if people had topics they'd like me to touch on. To this point, feedback has been virtually nil. I've started getting paranoid lately, thinking that maybe people weren't reading the Fitting Room and were ripping those pages out of AC to line their bird cages. (Or worse yet, they *WERE* reading the Fitting Room and then ripping out those pages. :-)

In any case, you have restored my dignity. I now realize that I have not been labouring in vain and this, in turn, has given me the spark I need to carry on. Just as well, too - with yet another deadline fast approaching.

If you like The Fitting Room so far, you'll enjoy the column I'm currently working on - it's a treatise on how not to build a circuit. It's tentatively titled "Things That Go KABOOM in the Night". And yes, it probably is what you think.

RE: Suggested retail prices for Atari products, year 1981.

If memory serves me correct, I bought my first system in late 1979 or early 1980 (when it first came out) and paid $975 for an 8K computer with Colleen operating system cart installed. I think I paid $150 each for three 16k carts when I realized that I could not live on just 8k of memory for programming space. I also bought two 810's at around $500 each, and an 830 modem for around $150 (gulp- 300 baud acoustic!). I still have the drives, the computer, and the original memory/os carts. I sold the modem a couple of years after I got it to get a whopping 1200 screaming bits per second modem! I wish I had kept the modem however....sq

(I think I paid $80 for the basic cart, and more for the assembler/editor as it was special order. It NEVER pays to be the first on your block- but as I said, I still have the original computer and drives. The floppy mechs (Tandon) were swapped out in 1984 when I wore out the heads from excessive use, the keyboard was swapped out sometime along there too, just wore out. I used that computer so much, my palms wore little holes in the plastic case where my hands rested while I typed. Memories.... :)

2672. Current 8-bit prices?

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-26 21:27:41 UTC
From: jdurand@mitre.org
Message-ID: <jdurand-260793170503@128.29.200.112>
Source record: 105777

I just donated a bunch of Atari 8-bit hardware & software to our church for
a fund-raising auction. Anyone care to put a value on it? I need to value
it for tax purposes.

BTW,
This equipment is forsale for the next few days only. I can still retrieve
it from the church. We would need to finalize the price by this friday
(7/30), & I would need to receive payment by 8/6. Otherwise it will be
auctioned at the Community Presbyterian Church in Chester, NJ on 7 August.
Will be sold in a complete package only. Buyer pays shipping. If your
interested send me E-mail or call me. I don't normally read this
newsgroup.

** Hardware **

All equipment working except where noted.

1 800XL CPU
1 800 CPU

1 810 Disk Drive
1 1050 Disk Drive
1 1050 Disk Drive (bad power supply & only reads/writes single density
disks)

1 Monochrome Monitor
1 850 interface device (bad power supply)

1 Okimate 10 color printer
1 Centronics GLP printer

1 1200 baud external modem
1 Koala pad - w/paint cartridge
4 joysticks

Cables

** Software **

To numerous to list individual items.

A large collection of 8-bit s/w from the atari archive

Letter Perfect
Data Perfect
Spreadsheet

Lot's of disks...

** Documentation **

All original documentation

2673. need help with 850<->modem cable

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-26 21:42:04 UTC
From: acsajz@hawk.depaul.edu
Message-ID: <1993Jul26.214204.25600@hal.depaul.edu>
Source record: 105776

I recently bought an 850 interface and I don't have the right cable to hook it up to a standard RS-232 modem. Could some kind soul mail me instructions for building one seeing as I'm too lazy to sit down and figure it out.

Thanks,
Aaron Zygmunt
acsajz@hawk.depaul.edu

[more deleted]

Whereas I will grant there is some connection between Robotron and Robots,
I think you are being overly harsh. Robots (or Daleks as I remember it) was
primarily a strategy game. You had no time limit to make a move, and every
robot simply moved toward you each move. The logic for defeating the robots
is very simple.

Now Robotron was a whole other ball of wax. First of all, most of the robots
did not try to kill you by running into you. Only the grunts. Saving the
humans from being squashed or reprogrammed was a fairly novel idea as I
remember games of the time. And shooting in a different direction than
you were running was a novel idea as well.

Robotron succeeded because it was fast, furious, and pretty much impossible
after a few levels. I always hated playing Daleks, because it was so
easy. Sure, Robotron adopted ideas from elsewhere. But ten years later,
we talk about Robotron, not about the games that introduced the ideas because
Robotron was the game that made all the elements work together.

Of course, if you want a flame war, go over to rec.games.video.arcade
and suggest that Mortal Kombat and Street Fighter II are just cheap
ripoffs of games like World Karate Championship by Epyx. ;-)
I'm sure they'll oblige.

2675. ANALOG magazine index, well, a start...

Newsgroup: comp.sys.atari.8bit
Date: 1993-07-26 23:20:49 UTC
From: chase@pion.rutgers.edu
Message-ID: <Jul.26.19.20.49.1993.11200@pion.rutgers.edu>
Source record: 105779

Atari Gaming Enthusiasts,

I recently filled in most of the gaps in my ANALOG magazine collection,
and as a result, I am in the position of offering an index of all those
great issues. Here is the first part, which includes only games.
But then again, all I want to know about are the games. Now I need
only to track down as many of these great games as I can. I will probably
produce some more indices over time, especially if given some encouragement.

Any glaring (or even minor) errors please point out to me in an email
message or a followup post.

I think a better comparison is _Berserk_ compared to Robots. In Berserk you
also could get two robots to run into one another, like you have to do a lot
of time in Robots.

>815 dual disk drive (double density).....$1499.95
> (WOW!!!)

Such a deal. :-)

>Comments:
> 100 Bucks for 16K

When I had my 800, 8K was $99.95, and 16K was $199.95. My machine came with 8K to start with. At my first opportunity to upgrade memory, I was faced with buying another 8K, or buying a 16K board for an extra $100. Now, I thought an extra 8K board would *double* my memory, and there was *no way* I could ever use any more than that, and so I saved the $100 and bought another 8K board! :-) A few months later I think, :-), I had t trash both 8K boards so I could bump the system to 48K. And of course even later, I had to trash two 16K boards so I could get a 32K board and something for the back slot. Does anyone remember the Austin-Franklin 80 column board?

It is true that some simple games as well as carts need UltraFix, or
UlTransator or whatever the heck its called now... <grin>
Gots me own 1200XL running rather dandily here!

Michael,

as I've been in the atari/8bit directory at archie.au just a minute ago, it
can't be a myth.

I admit it's not easy to find, but it's actually there.
The somehow lengthy path on archie.au is:

/alex/edu/umich/archive/atari/atari/8bit
^^^^^^^^^^^
not a typo!!

Nice to discover that we have more than just 2 mirrors of the archive worldwide.
Unfortunately the link to Australia is a little bit to slow for me :-)

hope that helps

>>I was trying to get it to do when I stumbled upon this trick ny accident.
>>
>Where can the OUR5OFT demo be found?

You can find it on atari.archive.umich.edu in the atari/8bit/Demos directory.
Its name is our5oft.arc

BTW: Does this trick work with mode $F vs. mode $E only? Is there a way to
switch between other modes by toggling GPRIOR from $0 to $40 and back again?
I've been playing around with this over the last weekend. It doesn't seem like
it would work with mode $2.

BTW^2: John, the demo doesn't run clean on your machine probably because you
have a NTSC computer, don't you. OUR5OFT simply needs some extra time during
the VBI. This portion of time is available on PAL machines only.

Marek

What about ANALOG's vaporware games? For a while they were running
pictures beneath the advertisers index with the caption "Coming Soon
in ANALOG Computing." I remember a fancy ICBM game played on a map
of the United States, HChess by Tom Hudson, and Tachyon by Brian
Moriarity. This last one looked like a clone of the coin-op Quantum.
As far as I know, none of these games were ever published.

If you don'twant your disk totally trashed, then DON'T DO THIS. Disks are written by aligning the particles on a magnetic media. When you heat the particles, you insert energy into them. This causes them to move are then you have a complete loss of data. Try heating a magnet and see what happens, or bang a temporary magnet on a hard edge a couple of times.

I think the best thing to do to the disk is copy whatever data you can onto a new floppy. Then go to the bad floppy and using a sector editor, see if you can reconstruct the missing data.

Good Luck

> on t.v. after spreading honey, jam etc. all over them? Nowadays you're told
> they don't even last ten years if kept mint - apparently the lasers fade
> them or something!!!!

Come on Simon "Tech" Trew. CD's are aluminum plates with pits in them.
There is no way they can fade. Some early laser movie disks had a problem
with the aluminum oxidizing or separating from the glue (movies are double
sided CD's), but that was and still is rare.

Now if you are talking about the new megnetic/optical writtable CD's, then
I'd say that there is a chance that they might have trouble in the future.

Which is what my original post said to do _first_. Anything else is done _after_ getting all the data you can from the damaged floppy, so that you lose nothing further by experimenting. Further, notice the _low_ heat portion of my original suggestion. Heat _will_ damage magnetic media, and indeed cause it to lose data. But, a _low_ heat from an iron, which would be much less than200 degrees F, _might_ straighten out the wrinkle, enabling more data to be read than before. Low heat, for a reasonable period of time, should not cause data loss, as evidenced by the cassette tapes sitting on my dashboard in the sun, which daily reach temperatures in excess of 140 degrees for hours. They do indeed detriorate, but slowly. And magnetic disks are saturation recorded, therefore have much more magnetization to lose before data is lost.

Thde important thing, and this may have been lost track of in this thread, is to sector by sector copy every sector of the disk to a good new disk first, thereby saving all information that is retrievable with the media as is.

The best response I read here was the one that recommended looping over and over again on a bad sector, hoping to get one good read. This is an excellant idea as part of the sector by sector copy.

There may also be a way of retrieving some data from a damaged sector.
My guess is that with the standard floppy interface (the serial
remote controller type) of the Atari, this may not be possible.
Does the drive return data even for a bad sector, or just an error
packet? With a (gasp choke) PC and low level driver software,
you would indeed be able to save _some_ of the data from a damaged
sector, or from any computer with direct hardware connection to the
floppy controller chip. It would be a piece of cake with my old
6809 system, its low level driver even handled 128 byte sectors
directly.

Once again, get _all_ _the_ _data_ _you_ _can_ from the floppy
copied onto a good floppy before trying anything drastic. After that,
what do you have to lose?

This is for Dag Hugdahl,

Dag, you should know KERMIT65 will not work with P:R:C REV3 boards (or lower-numbered versions if there were any). KERMIT only works with P:R:C REV4 boards. ICD made a *big* change in going from REV3 to REV4, including firmware revisions in that weird surface-mount custom chip. Open up your P:R:C box & look at the board, it will be clearly screened which revision it is. I doubt the problem is your modem. I've been using Supra 2400 modems for several years with the P:R:C & only discovered the difference between board versions by sheer chance when I picked up a 2nd P:R:C that happened be a different version. This drove me out of my mind & caused *MUCH* wasted time.

To my knowlwedge ICD made these changes quietly & never told anyone what they were doing to the innards of the box. When I inquired of them about it their rep acknowledged there had been "production changes" but feigned ignorance of what was changed or why.

ALSO: be aware the P:R:C is abnormally sensitive to the length of SIO cable employed in your system, even if the P:R:C is the first item in your daisy chain. The total cable capacitance will render P:R:C signals unreliable. There are only 2 ways to cure this: A.) shorten your SIO; or B.) get an SIO amp cable from CSS. I elected the latter route & it worked like magic. The SIO amp cable is a tad expensive ($29.95 I think) but I didn't mind that because the thing worked so darn well.

Yep, the drive does return data even on a bad sector. All you have to do is to ignore the error and to grasp the incoming data.
It's even possible with the cassette recorder. I've got a program somewhere that makes the OS ignore errors upon reading a damaged cassette.
That way you can at least try to restore your program from what is left.

This does raise the good point of temperature extremes and storage in general, information on which I wish I had more readily to hand.

As to temperature, a quick check in the library leads to a graph of coercivity versus temperature for gamma Fe2O3 (used for most Ferric recording media) which shows a drop of less than 10% at a temperature of 450 degrees C. In contrast, the CrO2 type media is much more sensitive ot temperature, having a Curie temperature (where coercivity goes to zero) of 112 degrees C. Hence CrO2 tapes would be _much_ more sensitive to high temperatures, and makes me glad I tend not to use CrO2 in my car!

The same reference mentions a study done at 160 degrees C with ferric media, showing a loss of 45% signal strength after an hour (this is signal strength, not data loss per se ... one would have to know the signal to noise ratio to determine data loss ... or measure it).

Not enough information for me, what prompted my trip was memories of long term storage effects, and a recommendation to copy, and hence start the magnetic deterioration afresh, stored magnetic media at intervals of something like 2 years. I will keep checking, but as I recall, in the range of 5 to 7 years one starts loosing data from digital recordings, hence the 2 year refresh recommendation.

This would of course get worse at elevated temperatures, like say an attic.

Now I may have a different problem <grin>. I have a lot of disks stored in my cellar, damp and moldy. It will be interesting to see what problems I have when I try to copy or use them. I am contemplating having to wash mold off in the sink, which I understand people have done with food and beverage contamination.

As i mentioned in my first post on this thread, experiment on a junk floppy before you try any of these unusual techniques! And copy what you can first! In line of experimenting, this has me curious enough that I am going to experiment myself tonight. Ten floppies, frshly formatted, in the oven in an Aluminum pan for AC magnetic shielding, and removing one per hour. We will see the results tomorrow.

To people having problems with BART: please forward your 'not sent
in three days' messages to brode@atari.archive.umich.edu. Jon won't
be able to figure out what's wrong unless he can see what's happening.
Since local mail service is fine, it's up to you to let him (NOT ME) know.

Secondly, it appears that the longstanding "when is wuarchive going to
be up to date" question has been answered....by the graces of the wuarchive
folks and some of the kinder a.a.u.e users, the mirroring software
should be working properly again. Enjoy....

Thanks,

Ah, the memories. I played most of these games at one time or the other.
I still have a lot of them on disks, but I don't have an Atari computer
out right now that I could use to go through my lists. I have a lot of
disks that I got with the magazines (particularly ANTIC) or from a guy
that had a subscription service. He used to type in all the programs
from Antic, Analog and Compute and sell the disk on a subscription basis.
A LOT more work than I was interested in doing.

If you have to type in the programs, pick the best ones. You can't go
wrong with Tom Hudson's programs (I still remember LiveWire like it was
yesterday) or Dave Plotkin.

You will probably recognize some names that have or still do show up
right here in c.s.a.8bit such as:

> 30 56 M/L Boulder Bombers, by Mark Price
> 35 67 M/L Arc Bonk, by James Hague
> 52 M/L Rambugs II, by Matthew J. Ratcliff

Others that I recognized but don't think there were ever on the net.

I got to thinking about this and maybe Richard has hit on the best
solution. Take the disk out of the sleve and put it between two nonstick
surfaces such as teflon (TM). Set it on a flat surface with a heavy book on
it in the sun. Let it cook for several hours. That should gently flatten
out the crease. Of course that would work best in nice warm climates.

Pre Atari computers, but I had a Super Elf. First RAM I bought for it was
2-256X4 bit Intel's for $4.95 each! The price of RAM went down to the
point where eventually I picked up a 4k static ram board for $139.95 I
believe. I added an A/D chip to the thingie 'cause I new there was no
way I would ever write a 4k program & I wanted to have some use for all
that extra memory.
BTW: Those KIM's I think you said you started off using were exactly free
if I recall correctly <g>.

>copy what you can first! In line of experimenting, this has me
>curious enough that I am going to experiment myself tonight.
>Ten floppies, frshly formatted, in the oven in an Aluminum pan
>for AC magnetic shielding, and removing one per hour. We will see
>the results tomorrow.
>

And now ..... results:

Oven temperature at 225 degrees F on the dial, I have measured it
in the past with a thermocouple, and I know it tends to run lower
than the set point by maybe 25 degrees or so, so we'll say set
for 200 degrees F.

Point .. if anyone else cares to try this, you might want to take
the media out of the sleeve that holds it in the drive. That plastic
gets _real_ soft and floppy, and continually out-gases a plastic
solvent type odor while heated. I am amazed my wife did not complain
about the smell. But, even with the soft sleeve, you can with
reasonable care remove the floppy from the oven, and it stiffens
relatively quickly. Of course, the media would still have to be
removed for reading, as the sleeve stays rather warped.

Placed a number of floppies in an aluminum cake pan, on a plate
about 3/8 inch from bottom of pan. An aluminum cookie sheet formed
a lid. The idea here is to eliminate an extraneous EM field
that might be emitted from the heating elements.

After one hour, removed one floppy and marked it. Similarly after 2, 3, 4.5, 6.75, and 12.75 hours. The floppy media was removed from the sleeve, and placed in another sleeve for reading. Originally formatted for MS DOS 360 K. Testing done with Norton 4.5 Disk Test program (DT.EXE).

Results: Hours Errors
1 None
2 None
3 None
4.5 None
6.75 17 bad clusters out of 355
12.75 72 bad clusters out of 355

Note: A cluster is 2 512 byte sectors. An error in either sector will cause the cluster to be a bad read. Also noted, all the bad clusters in the 12.75 hour disk were in the outer half of the disk, where the bit density is lower. The center of the disk had no errors. This correlates somewhat with my research yesterday in the library, one of the refereneces mentioned slightly that a higher bit density resisted self-demagnetization better.

While the disks were in the oven, I checked my iron out. Aluminum bottom plate, as I thought, and fairly thick. I thought to myself, I wonder if this is adequate to shield the AC field from the floppy. Plugged iron in, took a formatted floppy out of sleeve, placed it in a manilla file folder, and ironed away for a few minutes, leaving the iron plugged in and on. (Notice -- I DO NOT RECOMMEND THIS WITH USEFUL DATA AT ALL). The heat level was enough that I pulled my fingers away from the iron immediately, but not such as to burn my fingers from a short exposure. No data loss on the floppy when it was tested.

My conclusion is that short term exposure, less than an hour, preferably less than 1/2 hour, would not damage the data. Feel free to draw your own conclusions (I know my wife and coworkers are). And as always, use this information at your own risk ... it's not gospel, and certainly not definitive.

And most importantly, get all the data you can by conventional means before trying anything exotic like ironing your floppy. And unplug the iron! Why risk the AC field, when the iron will hold the heat just fine for a thin floppy.

I have one on my 400; price was about $100 back in 1982. All the keys
are the same size (except the space bar), but work very well (well, one
sticks now a little). Did the 48K upgrade around the same time - all in
all a nice little system. When I bought the 130 XE it was put in storage.

This treatise on salvaging damaged media has been extremely informative,
but what does the topic have to do with the Subject line of
"Gamers: heard of this oldie?"? I archive all of the Info-Atari8 digests
I get, as I suspect a number of people do, and several months from now I'll
never be able to match the subject line and the real subject without reading
the article. Which sort of defeats the reason for having a subjet line in the
first place.

I realize that some brain-dead news software won't allow one to change the
subject line, but if you're running rn or nn please take the time to
consider whether or not the subject line accurately reflects the topic being
discussed and, if not, change it.

I bought one in 1982, about 2 months after I bought my 400. It was the B-Key 400 and was made by Inhome. When my 400 died I salvaged the BKey it before I trashed the computer and just sold it to another 400 owner a month or two ago.

It was far better for typing than the membrane keyboard; with the membrane I let my fingernails grow and used them to type (rather than using my fingertips). The BKey, however, pales by comparison to the keyboard on my original 800. I always thought the keys on the BKey had a mushy feel to them.

> Anyone reading the newsgroup have one?

Yes, I have one in my old 400 that I haven't used in years. One design
sat very high when it was installed, but the one I have sits down in the
computer more. It looks almost like it was designed in. It works fine.
As I recall it was $79.95 plus shipping. I also made it a 48K machine so
it is equivalent to an 800. By the time I was done I could have gotten a
800 cheaper! But it has always worked fine. I stopped using it when I
upgraded to an XL machine.

Kit Kimes Congratulations Bulls!

There were two different keyboards made for the 400.

The first was the B-Key made by Inhome. It was low profile.

The second was a true full-stroke version that used the same internals as the 800 keyboard. It came in a large metal frame and was attached to the computer case with double-sided foam tape. This keyboard was sold by an outfit in Colorado (sorry but I'cant remember the name). I bought the last of their remaining stock about 7 or 8 years ago.

>(I've quietly deleted two other vendors blatantly
>selling commercial software as PD since I started maintaining the list this
>spring.)

This is simply amazing. What unmitigated GALL to advertise pirated softare
for sale! How do these idiots think they can get away with it? All it would
take would be 1 call to the SPA's 800 "pirate snitching" line and those
LotsaBytes would quickly turn into LoserBytes (as in the losers of a big
lawsuit). Do they think that because most of the copyright holders have gone
out of business that nobody is going to bother to prosecute them? Where
are their brains?!?!?!?!?!?!?!

You got me curious now Ben. I've seen Clock & Dagger a number of times & although I would'nt put it on my greatest movies ever made list, if you have a video store that rents movies for maybe a $1, it is worth it. Much better movie then DARYL in my op. Dagney Colemam of 9-5 fame plays both a kid's father & his imaginary friend. If I recall, a 5200 Cloak & Dagger game cart gets mixed up with a spy's cart that contains all kind of secret info. The typical computer nut (I think it may be the same guy as the fat guy in War Games) dumps the cart & all kinds of detailed schematics appear on screen, little do them peoples how hard it is to get them graphics on screen <g>. The kid's interaction between his real father & his 'friend' almost bring a tear to your eyes by the movie's end.
Make sure you post if you remember the 810/scope movie.

>in the center of the maze that would chase you and instead of a "pill" you
>would race to a "key" which would empower you to unlock a door and escape.
>
Spacewar was done on a DEC PDP-1 I think. I think I had Maze Craze for the
2600 before Pac-Man ever came out. Anyone remember that game? My mom loved
to play it. At least until Pac-Man came out (she pre-ordered it at JC Penney
weeks before it shipped :-)).

>"PAC-MAN(tm)" was --NOT-- an original idea by any stretch of the
>imagination!
>
There was a show about video games back when they were in their heyday (my
God I feel old). It was back in 82/83 (whenever Pac-Man arrived) and they
said Pac-Man was based on some japanese character (Pakoo or something). I
don't know if this interests anybody but I'm full of all kinds of useless
little facts. :-)

I've seen it. Don't remember the name of the movie either. BTW, the reactor
on the 800 reminded me of something. Does anybody know where I can find the
nuclear reactor gaem? It's where you monitor a nuke plant and have to adjust
the flow of water and avoid a meltdown. Chris Crawford was playing it on an
800 on the PBS series "Bits & Bytes." Anyone remember that either? Anyway I
always thought it looked like a neat game but I never found it.
Any help appreciated.

2720. 8-bit Atari Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-01 13:22:07 UTC
From: MCURRENT@carleton.edu
Message-ID: <01H1836WC9CY90MV2G@carleton.edu>
Source record: 105830

```
Atari Archive: 8bit/faq.arc

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 31-Jul-93

Additions/comments/corrections having to do with this FAQ List are
welcomed by its creator and maintainer, Michael Current:
Internet: mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

The 8-bit Atari FAQ List is posted on or about the first of the month to
the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many commonly
asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group. At this time the FAQ List is heavily geared toward describing the
various resources for the 8-bit Atari user available, with relatively little
information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. Hence no automatic
archiving of this FAQ List occurs, though there's usually a fairly recent copy
on the Atari Archive (see below) as the file 8bit/faq.arc.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
rec.games.video.arcade (includes products by Atari Games)
rec.games.video.misc (includes Lynx, "Jaguar")
rec.games.video.classic (includes 2600, 5200, 7800)
```

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the Internet side of this discussion group. All contributions to the Info-Atari8 Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. John Dunning would like this fixed, but needs help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. Our 8-bit Atari Archivists are John Dunning, jrd@atari.archive.umich.edu, and Jody Lenn, lenn@atari.archive.umich.edu. The Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP
a) FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4)
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1)
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

d) FTP to archie.au (139.130.4.6)
User: anonymous
Password: [your e-mail address]
cd alex/edu/umich/archive/atari/atari/8bit

Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to:
atari@atari.archive.umich.edu. The subject of the message doesn't matter, but
let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your Gopher server
doesn't provide a path to atari.archive.umich.edu, try the command:
gopher gopher.ius.itd.umich.edu

4. AFS
If your system has AFS capability, this is the easiest way to access the
Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.
It is especially important to specify that your upload is for the 8-bit
computers, since most of what Jeff receives is for the ST/TT/Falcon.

3. AFS
If your system has AFS capability, this is the easiest way to upload to

the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of
your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it
is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Free-Net via modem at (216) 368-3888. Those persons
with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts
are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG user directories are automatically
members of the official Atari user group CAIN - Central Atari Information
Network. Send correspondence and press releases to xx004@po.cwru.edu.

What product developers or vendors support the 8-bit Atari?
See the companion frequently posted text file, "All Known World-Wide 8-Bit Atari Vendors and Developers" for complete information. This file is posted to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group on or about the 15th of the month. There's also usually a fairly recent copy available on the Atari Archive as the file 8bit/faq2.arc

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
8bit/Cc65/dumasuu.arc - contains uud.com, uue.com, CC65 sources.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The Atari Archive contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc

8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note
that most require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari
users should treat themselves to either MYDOS or SpartaDOS to appreciate the
power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides
subdirectory and hard-drive support. SpartaDOS is a completely different
command-line DOS modelled after MS-DOS, though it is perfectly capable of
reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS
X is cartridge-based and includes many additional features. While it's hard to
argue that SpartaDOS X is not the most advanced DOS available, it is a
commercial product that is no longer manufactured. MYDOS, on the other hand,
is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for
complete compatibility with existing software, and then choose either SpartaDOS
or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs
available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No

Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)

XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

What are the pinouts for the...?

Anybody but me play Spelunker? Excellent game... Just about the only game
I've ever finished without cheating, too ;) Also Lode Runner, of course.

And, in case anyone from Norway is reading this, for some reason most of the
computer stores in Oslo are selling the 65XE with keyboard, light gun and
some games for 400-500NOK (about US$60-70), brand new. Well, I'm getting
one :)

>always thought it looked like a neat game but I never found it.

Sounds like "SCRAM," which has been around almost as long as the Atari 8-bit
itself; my first college girlfriend had it for her Atari back in 1981. I
may have a copy somewhere, but God only knows where...! It makes sense
that Chris Crawford would've been playing it, because it seems logical
to me that he probably WROTE it. It had his style and was around in C.C.'s
heyday...

>Make sure you post if you remember the 810/scope movie.

The latest issue of PLAYBOY mentions a CD-ROM database now available which lists every movie ever made, or something like that. All cross-referenced and lookup-able :-) . I surmise you could find the name of the 810/'scope movie if you could get a hold of that CD-ROM...

$.02, it's been my experience that vertical compression schemes compress
better then horizontal. There's an old DDJ with a "RLE Revisited" article
in it that you may find interesting on the subject. I think the guy who
wrote it got the last word. I took the absence of more articles/letters
to the editor to infer he had a good scheme. I know I still have the
article & I think I may still have the 'C source code on disk if you'd
like to see it.

Anybody but me have the version from MicroGraphicImage with music from
"Pictures from an Exhibition" played during the opening picture of a cave?
I don't remember what label the game was finally released, but the music
was definately a downgrade IMO.

Yes, I liked it quite a bit. I think I played it as recently as earlier
this year, but died in 'The Shaft'. I just couldn't remember the order to
do things.

I saw Journey to the Planets in that favorite game post, and I'm wondering if anyone is familiar enough with the game to get me past two planets I could never finish.

One had a rectagular box with a moving bucket, where you could drop things into and they would get changed into something else as they went around.

I don't remember the other one off hand, but I'll go find it if there's anyone out there that can help.

John Harris - jharris@cup.portal.com

That's a great list -- most of my favorites are on it.

A would add Marauder, although perhaps that's a bit unfair since my version is patched a bit. Instead of 8 direction control like a normal Berserk, my version uses forward, back, and left&right turns. Like the asteriods game.

I also played a great deal of Mousekattack in two player mode, but it's kind of tacky to bring up one of my own games. And it's not that great in one player mode either. With two players, you can each grab your two cats set them up on both ends of the tunnel, lure the mice in, and plug the ends so that they are trapped. Getting additional ones trapped was harder, since you have to open it up and risk escape of the others, but that's what made it fun.

John Harris - jharris@cup.portal.com

2731. Question about Rana

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-02 10:45:11 UTC
From: uj1g@rzstud1.rz.uni-karlsruhe.de
Message-ID: <23ir7n$o3c@nz12.rz.uni-karlsruhe.de>
Source record: 105841

A friend of mine just got a Rana diskdrive on a flea market. His problem
is he doesn't know a thing about it.

I've looked through all my c.s.a.8. LOG-files, but didn't find thery much
about it. All I learned is that the Rana is suposed to be a true double density
drive.

On the back of the drive there are 3 weird switches. Does anybody know what
they are suposed to do? One of them is apparently the drive number selector.
The second one is probably used to switch the density, but the third one?
No idea.

I've heared of a special RANA-DOS. Is this DOS something that works best with
the Rana drive?

Does the Rana understand some unusual SIO commands other than those on the 1050?

My friend's Rana has a track display, just in case it's unusual.

Any help appreciated.

From: ai792@cleveland.Freenet.Edu
Message-ID: <23isq8$rbe@usenet.INS.CWRU.Edu>
Source record: 105842

If anyone could point me in the right direction to find a nice
Ascii-to-Atascii file convertor program. I seem to have lost
the one I used. It had quite alot of options on it, and was
invoked via the Sparta_Dos command line. From what I remember,
it was fast as it did block reads, and none of this fgetc() or
fputc() garbage. [Which, IMHO, is slower than molassas in January]
(The equivalent calls would be get/put for any non C coder)

-BRiTiSH

BTW: Im sure that I'de probably be done writing my own, using the
XE-Banks and block read/writes, just a few minutes before some
kind sole points me the right way. :)

2733. educational software

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-02 11:38:08 UTC
From: dfwright@sadis05.kelly.af.mil
Message-ID: <CB4qzL.H26@sadis01.kelly.af.mil>

I have a stock 130xe that I was going to loan to a small school to use for the k-2nd grade classes. I was wondering what educational software might be available for these age groups, as I've never bothered to get any educatioal software before. Thanks for any replies.. I am especially interested in letter recognition, simple math (where the teacher can select the problems, not the computer only), and such.

2734. Re: fading CD's -- Urban Myth

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-02 11:57:30 UTC
From: trew@def.bae.co.uk
Message-ID: <1993Aug2.115730.5462@def.bae.co.uk>
Source record: 105849

```
#> they don't even last ten years if kept mint - apparently the lasers fade
#> them or something!!!!
#
#Come on Simon "Tech" Trew. CD's are aluminum plates with pits in them.
#There is no way they can fade. Some early laser movie disks had a problem
#with the aluminum oxidizing or separating from the glue (movies are double
#sided CD's), but that was and still is rare.
#
#Now if you are talking about the new megnetic/optical writtable CD's, then
#I'd say that there is a chance that they might have trouble in the future.
#
```

As I hope I made clear in the last article, I'm no great expert on CDs. I myslef can't believe they wear out, for exactly the reasons you have stated. But all I was saying is there is the myth out there.

Certainly I know people have had problems with bad recording at the outside edge of CD's - something to do with misalignment. I've never experienced it myslef but I have quite a good CD player. You get problems with the really long CDs eg some of Pink Floyd's.

Anyway this is not really the place.

Simon "So sue me" Trew.

I think there's one called 8bit/ascii.arc on the atari.archive.

2737. Special offers from DGS

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-02 17:21:39 UTC
From: djg0@aberystwyth.ac.uk
Message-ID: <9308021719.AA02513@deca>
Source record: 105846

A SPECIAL OFFER FROM D.G.S:

As you may know, DGS (my company) sells P.D. software for the Atari, as well as developing and selling commercial software products. We have had very little response from the US, so here's a special deal for Internet users (or anybody who has read this message really!). We usually charge $4 per PD disk for 1-9 disks, $3 for 10-19 disks, or $2.50 for 20+ disks. There is also 10% (minimum $5) to add for shipping. But, here is our special offer. For your first order, you can buy disks at just $2 a disk by buying a minimum of 5 disks. If you buy 15 or more disks we'll even pay your shipping charge!

All DGS PD disks are of the highest quality. 90% of them are double sided at no extra cost to you. We currently have 166 disks to choose from.

DGS has a printed catalogue which you can get for $5 direct from us in the UK.

For US orders, we accept payment in US$ in cash. Nothing could be easier!

If you want a catalogue then please send your $5 (in cash) to:

DGS
62 THOMSON AVE
BALBY
DONCASTER
DN4 0NU
ENGLAND

A catalogue will be sent to you via air mail straight away! Please make sure you mention that you read this on the internet/newsnet etc. This will qualify you for the special offer. BTW, it costs 50cents to send your letter from the US to the UK.

If you have queries then e-mail direct to: djg0@aber.ac.uk.

>
>I think there's one called 8bit/ascii.arc on the atari.archive.

This file is merely A2AT and AT2A which comes with CC65. This is
the beast which I am trying to get around. It works and all, but
to put things bluntly, it took 20 minutes to convert a 64K file.
(That was using 2 disk drives too, so add at least 5 more minutes
if the conversion is done onthe same drive. (physical ones))
This speed factor is a matter to me, as I have 3 more 360K Floppies
to convert; each one has 300k of code that needs to be converted.

One would be surprised as to see a dramatic speed improvement if
you merely read in all or most of the file into ram, and manipulate
it there before writeing it to back again.

BRiTiSH

PS: Never thought Ide ever see Color Attract go intoaffect on my machine,
but letting the A2AT run its course, I saw the machine go into Attract
mode so I hit a key, and then it went into it once more after I decided
to prepare myself a sandwich. After the 2nd attract mode, it took roughly
5 minutes til it finished. But hey, at least I had a nice way to time
things. :)

2739. Atari ROM REVB needed

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-03 05:00:09 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1993Aug3.050009.20197@ultb.isc.rit.edu>
Source record: 105851

Could someone out there email me a uuencoded copy of the Atari ROMs,
or tell me where I could FTP the binaries from?

Specifically I'm looking for the Revision B ROM's from the Atari 800
(most 800's had these, unfortunately I can only get my hands on the
old Rev A ROM's at the moment...)

Also, I could use the REV C (and D if there is one??) ROMs from the
XL/XE line, if anyone has those.

I know that the Atari Translator (which I can get from the archives)
has a modified version of the Rev B ROMs in it, but unfortunately it
is in DC3 format which I can't decode to a straight binary of the
10K ROM under Unix. (and my old Atari isn't functional enough at the
moment to use to convert it, plus I'm not sure how I'd get the data
to/from the Atari, since I don't have an RS232 for it)

For those who are wondering what I need this for, I'm working on
an Atari 800 (and perhaps 130XE etc) emulator in C that runs under
X-Windows (although the graphic part could be easily ported to
other graphic systems)

I'm going all-out with this so that all timing is done correctly for
video interrupts, etc...

I also want to simulate all kinds of Atari devices, so if anyone has
(or can tell me where to get) specs on things like Atari disk drives,
cassettes, printers, modems, etc... it would be greatly appreciated.
(as in the format of the data sent over the SIO, etc)

I also am having a little trouble with some aspects of my 6502 emulator
right now because the 6502 Assembly book I've got isn't detailed enough.
If anyone could send me cycle-timing info on the 6502, and info on
the status flags affected by every instruction, it would be great.

Thanks a ton for anyone who can help (I'll try to add the names of
anyone who helps me to the doc file that will go with this)

Also, if anyone has any ideas they'd like to see implemented for this,
let me know.

(The way it is structured, it could also be used to simulate an Atari
with multiple 6502's, or the 6502 could be attached to other hardware
simulators, such as Apple's or Commodores, although I'll leave that
part to someone else who better appreciates those machines.)

Again thanks for the help.

- Frank

2740. .arc file question

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-03 05:43:27 UTC
From: winters@access.digex.net
Message-ID: <23kttv$bfn@access.digex.net>
Source record: 105850

I have a probably, kind of a dumb question to ask, but here goes:
I just got a XM301 Atari 300 Baud modem with the XE TERM Communcations
Program. I traded a disk drive (which I paid approx. $6.00 for :-)) and
got this fantastic piece of hardware. Even though it runs slow (300 baud
is kind of yucky!), it is sooooo easy to use! I wish some of the programs
I use at work for Kermit & file transfer etc... could be so user-friendly.
(is is the more $$ you spend on software, the harder it is to use???)
I was told by someone that I would have to get a .ARC "dearc'er" kind of
a decompression program to download and use software on my Atari 800.
I was able to download a .arc file onto my disk drive, but have no
idea of what to do next. Does anyone know where I can get hold of a
program to de-archive .arc files? Thanks for any advice!
(just for the hell of it, I tried running the UUENCODE.BAS program on
the .arc file, but something tells me this is barking up the wrong tree,
big time! Oh, something I forgot to tell - When I was at Electronic Clinic
today, in Bethesda, Md., getting this modem, they told me that they are
getting many requests for Atari Disk Drives, but they can't even begin
to fill all these requests! I guess that proves that SOMEONE (besides
people on this newsgroup) is using 8 bit machines! I wonder why Atari
couldn't remanufacture these buggers with a new/improved floppy drive and
possibly a super fast hard drive. I guess they would rather sell $1,000
Falcons, which will be not-supported in four years, like everything else
they sell!! :--) I mean, I used to go into Toys R US quite recently and
see Commodore 64 and variations still being sold (ughhhhh!!!) for LOTS
of money! I saw one setup a few years back for about $250.00. Now, 2
years ago, I think I would have gotten a used ST for that or a little
more bucks, instead of spending so much money, just for an 8 bit machine...

>like to see it.

I heard this awhile ago also, and forgot it. Thanks for bringing it up.

I don't think I can read C good enough to get the algorithm out of it. I tried getting LZH compression that way, and I ultimately had to look at the object code to figure out some of the stuff. It's strange, because I know the syntax, but since I've never written any C code, I just can't visualize it. Conversely, I can usually read object code with no labels or comments relatively easy by comparison.

If you have some descriptions in English that you can send, I'd like to look at those.

2742. Translating MULE to BASIC

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-03 12:33:36 UTC
From: eric@ntsc-rd.navy.mil
Message-ID: <9308031234.AA22344@deepthought.cs.utexas.edu>
Source record: 105853

In April, Rick Cortese submitted the ACTION version of his MULE program
to read/write stock 1050 enhanced density files compatible with IBM
floppies formatted at 180K. I don't have ACTION, so yesterday I attempted
to translate this to Atari Basic. It was simple except for the satement:

```
PROC DINV=$E453()
RETURN
```

that is used by sections of code such as this:

```
;I.D. with Hello Atari
;
DEVNUM=2 ;DRIVE D2:
DEVOP='W ;write
SNUM=1;I.D. sector
SCopy (GPB,"Hello Atari")
Bptr=GPB+GPB(0)+1
Bptr^=0;'C end of string
FOR Bptr=GPB to GPB+127
DO
Bptr^==XOR $FF
OD
DBUFF=GPB+1
DINV()
```

I know that I cannot just do an X = USR(58451) call because the routine
at $E453 does not know to do a PLA to get the number of arguments off of the
stack. I tried to write a 3 line assembly routine to be called from a USR
call and placed it at page 6 (1536).

```
PLA ; pull number of arguments
JSR $E453 ; jump to subroutine
RTS ; return
```

Placing this at page six and doing a USR call resulted in the drive spinning
and beeping (seemingly reading several sectors) and then returning with
ERROR 9 (from BASIC). This occured the first time that the USR was called
when it was trying to read the "Hello Atari" identification at the first
sector. I had formatted a disk on my IBM at 180K and saved a program using
the C Mule program and was trying to read this disk.
Should I place certain values in the registers before JSRing to $E453?
What values does ACTION place in the registers when there is a call to an
OS routine such as this? Do I have to push all of the registers on the
stack when I call this USR and restore them before returning? Anybody know
off hand what Error 9 is (I'm just curious).
All of my Atari stuff is at the back of the attic and I'd prefer not to go
digging up there. Any help is greatly appreciated.

Eric Anschuetz (eric@ntsc-rd.navy.mil)

The Atari Archive file 8bit/Archivers/supunarc.com is the nicest program to
un-arc' files, and notice (by the .com extender) it isn't arc'd itself so
you can use it right away.

2744. Atari 520 ST system for Sale ($450 o.b.o.) 2.5 MB ram, 85 MB HD

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-03 13:16:53 UTC
From: koleda_k@msb.flint.umich.edu
Message-ID: <koleda_k.100.0@msb.flint.umich.edu>
Source record: 105705

I know this is the 8-bit list, but I thought some Atari user might be
interested in a newer Atari.

FOR SALE: MUST sell, ATARI ST system, 2.5 MB RAM, 84 MB HD, Word Perfect...

All of the items listed below for $450 O.B.O.
Best offer as of 8/13/93 takes it.

Hardware:
Atari 520ST (TOS in ROM) ...
External DS/DD drive, Atari SF-314
Mouse, Best Electronics
Joystick, Standard Atari (2)
Eazy-ST 2 Meg Ram Upgrade (total 2.5 Megs)
Monochrome Monitor, Atari SM124
Monitor switch box, Astra
Color Monitor, Atari SC1224
1200 Baud Modem, Atari SX212
Hard drive case, 3-5.25 inch bays/power/fan (Tech Spec.)
Supra Hard SCSI controller with clock
84 MB hard hrive, Seagate ST-296N, 28 ms access
1-Joystick Wico "Bat Handle"
Star NX-10 9-pin dot-matrix printer, extra ribbon, Epson/IBM

Software:
WordPerfect 4.1 (excellent spell checker and thesaurus)
Pagestream 1.83, with 16+ PD fonts
LDW Power 2.0 (Exports Lotus format)
G-Plus, Codeheads
Mavis beacon Teaches Touch Typing
GFA Draft Plus
F-16 Falcon (upgraded to hard drive installable version)
Stealth (telecomm software)

Atari Explorer, several years
ST-LOG
START numersous issues, many with magazine disks

Public domain software:
About 25 megs total on hard drive
Much duplicated on floppies
Utilities of all kinds
.IMG clipart
.TNY color pictures
Many excellent public domain games
Lots of GFA basic source code Included on hard drive

Everything in excellent condition. No known problems.

Prefer to sell as a unit. Actual shipping charges on most items -- or pickup in vicinity of Flint, MI (about 1 hour drive N. of Detroit).

That's only $450 o.b.o.

Please contact via e-mail.
Koleda_k@msb.flint.umich.edu

2745. Turbo 816

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-03 15:14:10 UTC
From: exuhag@exu.ericsson.se
Message-ID: <1993Aug3.151410.20452@exu.ericsson.se>
Source record: 105706

What is the Turbo 816 from Dataque? (Pardon if I goofed-up the product name.) I received some literature about their other products, a spreadsheet which can optionally make use of the Turbo 816 to name one. But it didn't mention the Turbo 816 as a standalone product and I didn't see it on the price list either.

I assume it is some form of 65816 "coprocessor" for the Atari 8-bit machines, but that's all I know. Anyone?

James Hague
exuhag@exu.ericsson.se

2746. Atari 8-bit computer items sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-03 16:31:27 UTC
From: cohen@BORN.phys.virginia.edu
Message-ID: <00970782.92A5EE80@BORN.PHYS.VIRGINIA.EDU>
Source record: 105709
Cross-posted to: misc.forsale,misc.forsale.computers.other,comp.sys.atari.8bit

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@GOMEZ.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).
I will respond to every e-mail message I get here (if you get no response,
please try again). PLEASE FEEL FREE to make any offer! I intend to finalize
sales within a few days, and will accept immediately offers that look very good
(if there will be any).

Thanks!

***** HARDWARE *****

Except where otherwise noted explicitely, all hardware was in working condition
when used last, and stored under very good conditions. However, if I have any
reason to suspect problems while packing, I will re-inspect prior to shipping
as appropriate.
When problems are known to exist, details are given.

Computer- Atari 800 in excellent condition, with manuals, 48K (max. expansion),
BASIC cartridge included.
Printer- Epson RX-80F/T in excellent condition, extra ribbon.
Monitor-
Green monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.

Atari CX853 16K RAM memory module for Atari 800 (I have 2 spare units)
Axlon RAM CRAM 32K memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
MPP CARD?/AT centronics parallel printer interface (hooks up a standard parallel
printer to Atari I/O port, no need for 850 unit).
(I do not have a manual for this.)
Atari power supply model # C061982 (for the XL/XE series I think).
Atari 1020 color printer/ plotter with manual.
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)
Atari 1010 Program Recorder - I have 2 units, Work fine.

***** SOFTWARE *****

Cartridges-
==========

BASIC (CXL4002) with manual
Centipede with instructions
Missile Command
AtariWriter Wordprocessor with manuals and original box

Disks- (All are original disks)
======

Lode Runner with manual and original box
TimeWise with manual and original box
Epyx Summer Games with manual and original box
Strategic Simulations Inc. Computer Baseball with manual and original box
Temple of Apshai with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Pinball Construction set with original binder and manual
Infocom Zork I with manual and original box
Micro League Baseball with manual and original box
Micro League Baseball General Manager/Owners Disk with original box
Atari Translator
Ghostbuster by Activision
CONAN (Datasoft)
Computer Baseball
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 100 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
apx Eastern Front 1941 (with manual and original box)
Thorn EMI Compute 4 and Reversi (in original box with instructions)
Thorn EMI Snooker and Billiards (in original box with instructions)
Atari Statistics I (with manual and original box)
Atari States and Capitals

Books-
======

Bill Carris- Inside Atari BASIC
Gardner- Software Protection and Code Breaking (book only)
ICD SpartaDOS Construction Set
Your Atari Computer
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition

Non-working equipment for parts, U-fix, etc.-

Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Atari 1010 Program Recorder - save: ok, load: no.
4 DISK DRIVES-
2 Atari 1050 drives, 2 Atari 810 drives, all sold as is.
They had various levels of problems, the 1050 spins and the light comes up
but it won't load, and one 1050 and one of the 810 were dead as I recall.

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

2747. BASIC ROM binaries needed

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-03 16:40:00 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1993Aug3.164000.13084@ultb.isc.rit.edu>
Source record: 105708

I posted a little while back about needing binary files of the OS ROMs
for an Atari Emulator I'm writing in C for XWindows (or anything else
it can be ported to)....
Well, now I got the OS (only revision A, which is why I want Rev B or C)
booted mostly correctly, but I need the ROMs for BASIC to run a lot
of the programs I wanted to run, to test out the emulator.

So, if someone would care to dump the entire range from A000-BFFF of
memory from BASIC to their disk and uuencode it and mail it to me, I
would greatly appreciate it, and I'll keep you updated on the progress
of the emulator.

- Frank

2748. New/old Atari 8-bit FTP-Site

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-03 16:55:10 UTC
From: uj1g@rzstud1.rz.uni-karlsruhe.de
Message-ID: <23m59e$dqc@nz12.rz.uni-karlsruhe.de>
Source record: 105707

We 8-bit Atarians have more resources on the Internet than we think off.

Today I've found another FTP-Site carrying 8-bit programs.

The interesting fact about this FTP-site is that it's not exactly a mirror
of atari.archive.umich.edu

Try FTPing to: cs.bu.edu and then switch to the /PC/ATARI directory.

I've done it a minute ago and I was amazed. It seems like this FTP-Site is
sort of forgotten by the whole world. Most of the files in there are from
around 1990 with some additions in 1992.

Of course, far the most of the programs there can be also found on a.a.u.e,
but not all!

There are some programs or shell scripts for Unix systems dealing with the
8bit. One of them is supposed to be an Atari MACRO Disassembler.

All directories look very tidy, you'll find a README file just everywhere.

I've included the README-File from the main directory below.

Have fun!

Marek Tomczyk

======= catalog =======

A short list of most of the available programs is
contained in the file CATALOG in this directory.

======= communications : "comm" directory =======

This directory contains programs that help in file
transfer and modem communications. Of particular
interest are the files uudecode.lst, yau.uue, unarc.uue,
and arcx.uue.

======= languages : "lang" directory =======

This directory contains programs which require a specific
language (such as basic code, C code or Action code) or
are themselves a language. (such as ACE C or TBASIC).

This directory has a few subdirectories:
"action" which contains programs written for ACTION!.
"clib" which contains the runtime engine of the ACE C compiler.
"turbo" which contains TBASIC and its support files.

======= utilities : "util" directory =======

This directory contains files which provide general
usage utilities, such as SHRINK and and the TEDIT
editor.

======= unknown/general use : "general" directory =======

This directory contains programs whose use is uncertain
as well as a subdirectory for games called "game".

======= non-atari : "foreign" directory =======

This directory contains files and programs which are not
executable on the atari 8 bit computers but which do
pertain to the atari 8 bit.

======= atari-newletter : "info" directory =======

This directory contains some of the atari 8 bit newsletter
and distribution group info-atari8. They will be saved

by volume and issue number.

======= atari news and general information : "news" directory =======

The files in this directory are messages and notes on various
topics that I thought might be of interest or lend some
help to atari 8 bit users.

Hey, I actually have a couple issues of this magazine that I picked up at the Summer CES here in Chicago circa 1984. If they are really worth this much, I'll dig them out and try to sell them too. :-)

Kit Kimes Congratulations Bulls!
AT&T Resource Link (under contract to NCR) What a 3Peat!
Naperville, IL Thanks for a great year.

> That's a great list -- most of my favorites are on it.
>
> A would add Marauder

I agree that it covers a wide range of the better games, but I would add one more that I haven't seen discussed for a long time. That is 'Spare Change' by Broderbund. My son and I probably spent more time playing that game than any except for 'Miner 2049er'. It had nice graphics, nice gameplay and catchy music.

Kit Kimes Congratulations Bulls!

-> CD-ROM...
->
-> Chris
-> Chris_F_Chiesa@cup.portal.com
For everyones information.

There are probably a few CD-ROMS of movie info. The one that I've used is called MicroSoft Cinemania, which offers short reviews from Leonard Maltin, actor profiles, and sound clips from a small portion of the total content. It has an extensive text search capability, and I would suggest a FAST cd-rom drive for optimum usage. It's also updated on a periodic basis to cover more recent movies etc. There are no movie clip animations on this disk.

If you work and spend alot of time in movieland get this disk.
Otherwise you'd be better off getting a movie review book.

2753. Wanted: Kraft joystick (Atari compatible)

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-03 23:21:54 UTC
From: hiebeler@santafe.edu
Message-ID: <HIEBELER.93Aug3232154@zuni.santafe.edu>
Source record: 105716
Cross-posted to: rec.games.video.marketplace,rec.games.video.classic,comp.sys.atari.8bit

I'm looking for an old Atari-compatible joystick made by a company called Kraft. The joystick is fairly small, the stick is about as thin as a pencil; the whole thing is black with 2 red buttons (so people can use the stick with either the left or right hand; both buttons send the same signal). Let me know if you have one you're willing to sell.

Here's a strange question... Can anyone recommend a good ARC program for the IBM which produces ARC files which can be un-ARCed by the ARC programs on the Atari? I've downloaded the entire 8-bit archive to by IBM, where I would like to un-ARC, review, and re-ARC the files for transfer to the Atari (my IBM has a huge hard drive, my Atari does not). Thanks.

2758. Broken 1050 disk drive?

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-04 17:53:40 UTC
From: syzygy@eskimo.com
Message-ID: <CB8xID.4yJ@eskimo.com>
Source record: 105719

I picked up an Atari 1050 at a thrift shop yesterday, hoping it would work. Well, it doesn't quite seem to, so I have a few questions.

When I turn it on the power light comes on, but then it just sits there. If the power is on, however, and I toggle it off and then back on again quickly, the motor that spins the disk starts trying to run. I say "trying" because it just turns very slowly and mostly just makes a grinding noise.

Some questions:

I've never owned an Atari disk drive before; is it normal for it to only start spinning the disk if the power is toggled off and back on quickly? This doesn't make sense to me, but it seems strange that this would be the problem.

Apparently someone else had the thing open before I did, and it looked like they had some of the connections from the electronics to the drive wrong. I looked at them, and they were labeled with numbers like "J10", "J12", etc., and had a small number "1" printed on the bottom. Apparently desgnating pin #1. There were apparent matches to these numbers printed on the circuit board that they plugged into, so I plugged 'em the way they seemed to match. Did I do this correctly?

What are the settings for the "drive select" switches near the back of the drive?

It didn't come with power supply or SIO cable, so I'm using some from a 1010 tape drive I have. This should work, shouldn't it?

I don't have any disks with DOS on them; is this required?

Does anyone have another broken 1050 (preferably in the Seattle area so I don't have to pay a lot of shipping) that I could take off their hands in hopes of making a working disk drive from the two?

Thanks in advance for your help.

Not such a strange question. ARC can use a few different compression
methods. Super ARC/unARC for the Atari can handle all of
these, along with PKPAK "squashed" files (but that requires
an expanded memory Atari).

I found ARC v6.02 for the IBM on the site I call (Portal), you
might find it on an ftp site.

Source record: 105752

You right in that it can be translated to Basic fairly easily, a couple of versions were in Basic. I just prefer Action!
Nothing goes in the regs for the $E453 call, your code should work. Make sure you have intitialized your string before you do the call so in isn't packed.
i.e. BUF$(128)=" " before you do the call or you will get a string error.
Also the Action! syntax goes something like; add a '=xxx' when you define you variables & that variable will now reference a memory location so:
BYTE RIGHTMARG=82;defs RIGHTMARG as a byte at mem loc 82
RIGHTMARG=0;stores a '0' at mem loc 82

I used that type of defs all through the program so you will have to change these to POKES & 2 byte wide POKES for CARDS

Spare Change was a Broderbund title from '83. You are an owner of an arcade. Characters called Zerks escaped from one game and torment you.

They try to steal your tokens and put them in their piggy bank. You can put tokens in the jukebox, the telephon, pop-corn machine and other devices to keep the Zerks occupied.

Between levels you get to view the 'Zerk Show'.

Rick asks about translating 'Mule' from ACTION! to BASIC.
I think $E453 (DISKINV) has a RTS at the end of its routine.
Therefor you need a PLA, JMP $E453 instead of PLA, JSR $E453, RTS.
Although I don't see why yours won't work really. Error 9 is a
string dimension error that can show up at weird times.

Source record: 105728

In a previous article, exuhag@exu.ericsson.se (James Hague) says:

>What is the Turbo 816 from Dataque? (Pardon if I goofed-up the product
>name.) I received some literature about their other products, a spreadsheet
>which can optionally make use of the Turbo 816 to name one. But it didn't
>mention the Turbo 816 as a standalone product and I didn't see it on the
>price list either.
>
>I assume it is some form of 65816 "coprocessor" for the Atari 8-bit machines,
>but that's all I know. Anyone?

This is an article by Jeff McWilliams taken from the Product Reviews board
in the 8-Bit Computers Support Area of the Cleveland Free-Net Atari SIG:
/\/\/\/\

The Turbo816 is a 65816 microprocessor that runs at the normal clock speed
of the computer. It's meant to be installed in a XL/XE machine, and comes
with a replacement OS. The card measures about 3.5x7", roughly the size
of two 3.5" disks end to end. On end is a 40 pin ribbon cable which plugs
into the 6502 socket on the motherboard. On the end is a 50 pin connector
for attaching Turbo-BUS cards, like SRAM memory, PROM application cards,
hardware interface cards, blah blah.

The 65816 has two operating modes, emulation mode, and native mode.
In emulation mode, the chip acts mostly like a 6502, but more OPCODES
are available, as if you had something more than a 65C02 in your machine.
See the MAC/65 manual on 65C02 opcodes for more details.

In native mode, you can set the accumulator, x and y register to 16 bits.
Two separate registers the data bank register and program bank register,
let you do 24 bit addressing. The Turbo-BUS, the 50 pin connector, provides
all 24 address pins and 8 data pins, for a 16 megabyte LINEAR addressing space.

new opcodes include program counter relative addressing for true relocatable
code, data block move commands, new addressing modes, and the ability to
move page zero, now called the direct page, to anywhere in the first
64K of address space.

The Operating System, called the Turbo-OS by Dataque software, is a rewritten
version of the XL operating system with additions. These include a callable
menu which lets you test your internal hardware, examine any and all memory,
determine which and how memory memory is available, and call Turbo-Apps which
have been initialized from their PROM cards. There are also some memory
management routines in the OS and some other nifty routines callable from
software written explicitly for it.

The OS does have some timing problems however, and the 65816 does not
in some cases execute 6502 OPCODES in the same number of cycles as the
true 6502 does. The combination, plus another problem inherant in the
earlier 65816 chips causes some compatibility problems.

It's been reported that the Black Box didn't work with the T-816, and I
had personal problems with both a MIO and a Newell 1088K upgrade with
the T816.

Dataque provides SRAM cards, in several configurations, including 64K and
256K. Dataque also had the Turboclock, which was a 32K SRAM, and 32K PROM
card with a battery backed, Dallas Semiconductor real time clock.
A clock program was callable from the OS-Menu which would set the Dallas
clock, or read the Dallas clock and set the SpartaDOS clock. These routines
were also callable from software.

Dataque also provides a 65816 assembler , and a beta 65816 debugger.
No high level language is available for the Atari 65816.
THe only application seen for the 65816 is Turbocalc from Dataque.
This is a rewritten version of Speedcalc from Byte, on cartridge.
The spreadsheet will run on either stock or 65816 computers.
If a 65816 is running with a memory card, the largest contigous block of
RAM was usable by the spreadsheet. I had a 256K card, plus the
CLock card with 32K or RAM. THe Spreadsheet make the 256K available to itself
for spreadsheet use. THe spreadsheet was good, I liked the drop down menus,
but there were some routines that were buggy. The move data routine was
buggy. You had to be careful how you used it, and only move or copy cells
to other empty cells. Moving or copying cells on top of other filled
cells resulted in spreadsheet corruption.

The fact that RAM was only expandable via SRAM was a problem.
SRAM is physically larger than DRAM, and more expensive. It is impossible
to fit the T816 card and any RAM card into a XL/XE except the 1200XL.
Wiring up a 4 meg or 1 meg SIMM would have been more useful. I think
it could be done personally. Bob Woolley had some 1200XL schematics where
he used just the REF and CAS signals from the ANTIC chip to enable
automatic refresh mode in a 1 meg SIMM for a 1024K XE type upgrade.
These same signals should be somehow usable in wiring up a SIMM that was
addressed through the 65816, since the 65816 is still wired up
in SYNC with the ANTIC.

The T816 has POTENTIAL.. look at the Apple IIgs crowd, but the lack of
smaller, cheaper RAM, real applications, and a high level programming language
like BASIC, C, or Action!/816 prevented the 816 from becoming anything more
than a hardware hacker's toy. Mine has been unused for years. I put over
$400 into all the goods, and haven't got any honest use out of it. Truly
one of my worst 8 bit purchase decisions. Nevertheless, I still dream about
someday putting it in a 1200XL and finding time to program my own stuff for
it.

Does anyone on this newsgroup know whether Electronic Arts ever released Marble Madness for the Atari 8bit. I know there was an ST version and even a Commodore 64 (ugh) version. In going through an old Antic magazine, I saw where EA had promised to make it available for the 'Classic' line. I remember waiting back then for it to become available, but that was about the time that most commercial vendors began abandoning Atari.

We had a game where the marbles rolled down a maze with various trap
doors. The doors would open & close at random, and redirect the marbles
at the bottom. You had to catch them. I seem to remember getting a
bigger house every time a level was completed. Does this sound similiar
to what you are looking for?

This game is called Gumball by Broderbund (???), the object of the game is to
catch multi-colored gumballs as they come down pipes into the CORRECT
bin... If you get a wrong color the foreman comesout and dump out all the
gumballs in your carts...

All this and a quote/time limit too... Never did finish that game

I know Marble Madness has been reviewed in the German magazine "Happy Computer" around
1985-86. They showed a screenshot of the Atari 8-bit version.
It was supposed to be a great game. I think some mailorder companies over here
did sell it actually.

Marek

A conceptually similar game was sold through APX: Bean Machine. Beans
("marbles") were hauled up the right side of the screen and let loose
at the top. They rolled down a series of teetering platforms that
you could tip left and right. I never played it, but I thought it
looked interesting. Ditto for dozens of APX games I never had the
chance to play.

The name of the game is called SCRAM it was one the 1st games available for the Atari. The program came on cassette so you need a 410 or a 1010 program
recorder to load and play this game.

As to where to get it probably flea markets, swap meets, & garage sales as I doubt any dealers nowdays sell cassette format programs anymore.

BTW, Cris Crawford is the one who wrote this game, that's probably why he was showing it off on that show.

I've fix a dozen or so 1050's now & will ACK other people may have had other problems, but what I've found: 75% of the problems are with the 12V power supply [cr15, cr16]. 15% have the controller chip go which makes it cheaper to buy a used drive then try to repair them. The other thing that goes is the track zero sensor. I've got the SAMs 1050 repair manual & it really isn't that great unless you have an scope. If I recall corectly, all motor spin/fail to spin problems ('cept for controller) were 12V supply problems. When you have the track zero sensor go out, you just take the cover off the drive. What happens is the head gets brought to track zero & you may or may not get a good starting read. The next time it looks for track zero a 'bad sensor' tells it the head's on track zero already so after each try, the head advances across the disk.

If I remember correctly, DOS 2.5 had some "strange behaviors", lack compatibility due to a highj MEMLO location, and was pulled off the market fairly quickly.
SpartaDOS is still the best DOS I found for "late model Ataris".

Not yet, but there will be.
I'm writing an Atari emulator for Xwindows right now, but most of it
is generic enough that for my next part of the project I'll be
translating the video part to VGA graphics, (maybe I'll consider EGA
support for those without VGA, although it will degrade the Atari's
colors, but CGA is RIGHT OUT)
and adding some sound support as well (something I couldn't do under
Xwindows)
It will, however, require a 386 or 486 to run properly because there's
a LOT of special graphics hardware on the Atari that an old 8086 or 286
PC could never keep up with simulating correctly.

So, if you can be patient... it will be done. (or, once I upload the
Xwindows version, if you want to port it to the PC, feel free)

>Does anyone know how much a mint 130XE is worth? I am thinking of selling
>mine. By the way, does anyone know why the case has yellowed over the
>years? I bought it in '85. Please respond via e-mail. Thanks.

The material used in the case is a styrenic with molded-in color. Sty-
renics are notoriously sensitive to UV radiation (such as in sunlight
and some fluorescent lamps), and will yellow badly under the proper con-
ditions. It is primarily a surface phenomenon and will have minimal
effect upon material properties unless carried to extreme. I have an
ST bought second hand that is badly yellowed, and I suspect that it
spent much of its life near a window.

As far as I know, Mydos isn't available in cartridge. You can ftp it from atari.archive.umich.edu, or download it from any of the major online services (Compuserve, GEnie, etc.) or from a local BBS if you can find one that still supports the Atari 8-bits.

DOS 3.0 was the one that had compatibility problems, and was replaced by 2.5.
Then there was DOS XE, but by the time that was released, it wasn't long
until Atari quit supporting the 8-bit computers.

Has anyone ever messed with DOS 4.0? Supposedly, it was developed
by Atari and was much, much faster than 2.5. Something went wrong,
because it ended up being dumped rather quietly as freeware. I assume
there were serious compatibility problems or maybe it was just outdone
by various third party alternatives.

As someone who was heavily into the Atari 8-bit world from
1980 until about a year ago, when I kinda fell out of touch,
I've got a couple of questions....

-Did AIM ever resurface?

-Whatever happened to AtariUser? As far as I can recall now,
I still had a subscription, but they just stopped coming
back around Christmas or so.

-Is Current Notes still around? I let that subscription lapse
last winter and rather miss it....it is/was a good mag.

-Is there any good PD/shareware that's come alon for the 8-bit
within the past year or so?

-Has any new commercial stuff from Europe come along lately?

-As of a year ago, the APDA on GEnie were working on, and
planning to release a MIDI-Maze type game for the 8-bits.
I forget the name of it, but did it ever come about?

-And finally...how's Atari doing these days? Did they ever get
the Falcons out on dealer shelves? And wqhen is the (rumored?)
Jaguar system due out?

-Ray

ps - yes, I've REALLY fallen out-of-touch this past year! :-(

Our favorites tended to be 2 player at the same time games.

Dogdaze: You and the other player compete to mark fire hydrants, if you touch one marked by your opponent, you get frozen for a while.

Mousekattack: You and the other player are plummers laying pipe in a sewer. Watch out for rats. You have non-moving cats to block the rats, also your cat will also block your opponent (let him get trapped between a rat and your cat).

Wizard of Wor: A maze game, you shoot at various bad guys and each other.

Archon: A game somewhat similar to chess, but you fight it out to take possession of a square on the board.
Joust: you and your opponent ride giant birds and try to knock each other out of the air.

Mule: up to 4 players colonize a planet.

Some single player games we liked:

Miner 2049er: A jumping and dodging game.

Jumpman: similar to Miner2049er.
Shamus
Shamon: An adventure/maze/shoot-em-up game.
Crossfire: A grid shoot-em-up game.

Loderunner: A running Jumping avoid-em game, also you can make your own screens.

Qbert: Another jumping avoid-em game. Also there were a few similar games whose' names I can't remember right now.

The graphic program that demonstrates the new color ability is probably not going to be ready for several more days. I've added more to the program than I thought I was going to do, I'm writing a bunch of documentation to explain it all, and as usual I am getting timeshared into other things at the same time.

One thing just finished, is the ability to automatically draw into any PMG element that happens to be under the cursor, no matter how many times they are repositioned or scaled in width. This turned out to be harder than I thought, since you can't just read hardware registers to find out where the things are. I'm keeping track of all position and sizing commands in a table, and matching things to the cursor location.

I played with automatic positioning of PMG elements as you draw. You could draw anywhere, and the program would move any available PMG elements to the cursor location. I felt it would create a lot of problems, and that the problems would be harder to clean up than manual positioning in the first place. At this stage, the program is still intended solely for coloring existing pictures. As such, it is pretty easy to see objects that can be colored effectively with PMGs, and manually position the players in the right spots.

From: ab588@yfn.ysu.edu
Message-ID: <2444ou$m2o@news.ysu.edu>
Source record: 105669

The "Z:" handler is on the SpartaDos Construction Set for use
with the R-Time 8 clock and BASIC using the XIO routines.
You have to load the handler first then use the routines like
XIO 38,#IOCB,0,0,"Z:" will turn on the time/date display (same
as TD ON). it is also used to read or set the date or time in
formatted or unformatted string. See the R-time 8 supplement for
SDCS used only with SpartaDos3.2d or xcart. I have a progarm that
sets the jiffy clock with the Zhandler to remember the date when
thecomputer is powered down and then up again so you don't have to
keep typing in the date if you have no R-time 8<-I use this cuz
my R-time 8 is broke.

2809. Want to trade ST for 8bit stuff

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-09 00:30:25 UTC
From: darreld@access.digex.net
Message-ID: <darreld.744855770@access>
Source record: 105670

I have a 1040ST in good condition, and an Atari color monitor for
trade. The ST is in good condition with TOS 1.4 and a BUNCH of
software.

I would like to trade it for a COMPLETE 8bit atari system. I need
at least 800xl (prefer 130xe)
1050 disk drive
MUCH software
printer (will do without for 2 drives)

I haven't used my ST for a while but wnat my kids to be exposed
to the EXCELLENT 8-bit environment I remember. (This move has
NOTHING to do with the plethora of excellent games there was/is
for the atari 8-bit. It's a serious thing.

Some of the software available for the ST:
Laser C
Wordflair II
a BUNCH of shareware stuff
much games
Flash 1.6
Stalker 2
Wordwriter ST
Falcon 3.0
Flight Sim
Personal Pascal
too many more titles to list

I also want a bunch of software for the 8-bit.

Send EMAIL replies

Just got back from visiting my in-laws in the Berkshires (the extreme Western end of Massachusetts, for the geographically-impaired among you), at their new house. The new place lacks the pool they had at the old place, and so they used the difference in upkeep expense to spring for cable TV for the first time. Dad-in-law was showing me the local info channel for West Stockbridge, and boy did those graphics modes look familiar! It was an Atari 8-bit, near as I could tell without going there. John (Harris), I'm reasonably sure it WASN'T _your_ product, since they weren't showing images or mixing graphics modes, but I thought I'd mention it!

Message-ID: <1993Aug9.060953.29239@ultb.isc.rit.edu>
Source record: 105673

This is just to let you all know that I no longer need the Atari
OS ROMs. I managed to find and read revision A,B, and C ROM chips.
I also have Rev C Atari Basic now (although I seem to be having
conflicts between it and my emulator which I'm not sure of the cause
of--- I think I read the chips fine, so it's probably the emulator's
fault... but if I find out otherwise, I'll post again to ask for
the Atari Basic cart ROMs)

Thanks for all the replies I got earlier, and I'll be posting a status
update on the project later this week.

- Frank

2813. Questions: Atari Corporate History

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-09 10:11:03 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.744891063@garbod26>
Source record: 105674
Cross-posted to: rec.games.video.classic,rec.games.video.arcade,comp.sys.atari.8bit,comp.sys.atari.st

Could somebody please help me with this brief list of Atari's history?
I haven't been able to fill in the years for several important company
events. Any additional information is appreciated.

1972: The company, Atari Inc, is founded by Nolan Bushnell. Bushnell's
intention was to use the name "Syzygy", but since it was already
occupied, he picked "Atari" instead.
197?: The Pong game becomes popular in the arcades.
1976: The Atari 2600 is released.
1979: The Atari 400 and Atari 800 computers are released. The computers
had inofficial name, "Colleen" and "Candy".
198X: Nolan Bushnell sells Atari to Warner Communications.
1983: The Atari XL series is introduced, replaces the 400/800 series.
198X: The Atari 7800 is released.
1984: Jack Tramiel leaves Commodore and buys Atari from Warner. The company
is split into Atari Corp (consumer products) and Atari Games
(arcade games).
1985: The Atari 520ST computer is introduced.
The Atari XE series, compatible with the 400/800/XL series, is
introduced. (65XE, 130XE.)
198X: Atari buys the Lynx from Epyx. The Lynx was developed by XXX.
198X: The Atari TT computer is introduced.
198X: A portable ST named Stacy is introduced.
1989: The Atari STE series is introduced.
1993: The Atari Falcon computer is made available (?) to consumers.

It would be nice to have the names and years of introduction of some
popular arcade games as well. Since I was too young to take part of
the action in the early years, I can't remember what games were
created by Atari. Suggestions: Missile Command, Pole Position (Namco?),
Pong, Breakout, Galaga, Battlezone.

Anyone who's interested in this subject should feel free to edit the
list and send replies to my email address. I'll read the newsgroups
as well.

Thanks in advance,
Anders Skelander

2815. Converting binaries on cassette to disk

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-09 14:43:30 UTC
From: manf5853@toyota.gmi.edu
Message-ID: <manf5853.744907410@toyota>
Source record: 105677

I have just ran across cassette versions of Jawbreaker and Pharoa's Curse for $3.00. I didn't buy them because they are on cassette, and I hate waiting for them to load. Driving home I was wondering if it would be too difficult to write a simple program to transfer the data from cassette to a dos file. Before I attempt to do this I would like to know if I am wasting my time. I don't know much about how the computer stores data in either format, so all I would be able to do is a basic read and write. Are there any problems I would encounter that would render my binary file useless?? Probably a stupid question, but I am open to any input.

Thanks,
John

There's a couple of programs that'll do the job, the only problem would
be if the programs are multi stage load programs. Some of the later
cassette programs loaded a program that then took over the computer to
load the actual game. As far as I know there's never been a program that
can handle these multi-stage loads.

The following Atari 400/800 hardware, games and books are for sale.
All games are cartridges. If you don't like my prices, make me an
offer for what you consider to be a fair price. (I will also consider
discounts for purchases of more than one item.) Shipping cost is not
included in the prices below (buyer pays shipping).

Price Item Included Notes

$45 Atari 800 48KB Power supply makes buzzing
Owner's Guide noise, but works fine.
BASIC Cartridge
BASIC Reference Manual
Atari BASIC: A Self-Teaching Guide
1 Joystick

$2.50 WICO Joystick w/3 interchangeable BROKEN: up switch does not
joystick handles work. Otherwise, good.

$10 Trackball analog or joystick emulation

$15 Star Raiders Docs.

$10 Missile Docs. Press CTRL-T to switch
Command game into trackball mode.

$10 Defender Docs.

$10 Donkey Kong Docs.

$10 Ms. Pac-Man Docs.

$10 Pac-Man Docs.

$10 Centepede Docs.

$10 Joust Docs.

$10 Pole Position Docs.

$10 David's Docs. Pinball simulation
Midnight Magic

$7.50 Robotron: 2084 Docs. No dual joystick tray.

$7.50 Asteroids Docs.

$7.50 Dig Dug

$7.50 Gorf

$7.50 Wizard of Wor

$7.50 Galaxian

$5 Submarine Commander

$5 Soccer

$5 River Rescue

$5 Castle Hassle

$5 Necromancer

$2.50 Droids Free with purchase of
any two items.

$5 Atari Games & Recreations Book for novice Atari
by Herb Kohl, et al. users/programmers.

$10 Your Atari Computer: A Guide to Book for novice to
Atari 400/800 Personal Computers experienced users and
by Lon Poole, et al. programmers.

Various product literature/catalogs/documentation free with any purchase,
just ask (I only have one of each):
-Discover the World of Atari Home Computers, 1982 catalog
-Atari 1981 Software Catalog
-Fact Sheets for the 400, Controllers, 410, 810, 815, 820,
822, 825, 830 and 850
-Atari 410 Program Recorder Owner's Guide

>to write a simple program to transfer the data from cassette to a dos file.

Depends what you mean by "too difficult!" Depending on whether the cassettes
use "short" or "long" inter-record-gap format, BASIC may not be able to read
records from tape fast enough. What other languages do you have/know? Boot
tapes are almost certainly in "short gap" format, meaning you'd have to
write your program in ML or Action! or something fast along those lines.

That aside, such a program is QUITE feasible. However, simply reading the
raw bytes from the tape and putting them in a disk file is only half the
job, because the boot format (i.e. where in the "boot file" a load-address,
run-address, etc. are specified) is DIFFERENT between Tape and Disk, as
well as between boot-disk and load-and-go executable DOS file. You'd
certainly have to convert boot-tape format to one or the other disk format.

And then, all of THAT aside, there are surely a number of programs Out
There already that do this very conversion FOR you. You almost certainly
don't have to write ANYTHING. :-)

Hope this helps,
Chris Chiesa

Taking about '2 player at the same time' games, I just LOVE Aztec Challenge.

In this game there are two guy's (each controlled by one player) that walk after eachother while some nice graphics scrolls by. You had to complete the levels by jumping (low, normal, high).

These levels were called : The Grounds, The Columns, The Ground and the Columns (a mixture of the previous two), the Fire Caves, the Gems and the last one I forgot (maybe someone else knows).

I you completed a level without any mistakes you got an instant replay (at double speed I think).

The trick was to keep concentrated on your own guy, but when you noticed that the other one was going to goof up chances were big that you would make a mistake before he did. It did occur frequently I shouted 'JUMP' to the other player and in the meantime I walked against an obstacle and died. So if you played with an player that was unfamiliar with the game you would keep your eyes pointed on his sprite and chances were big that you made the most mistakes.

Boy, did we play that game a lot and if it hadn't been on cassette we would have played it even more.

Did someone else have the same experiences with this game or is it just me.

2828. Atari Corporate History - 2

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-10 13:17:40 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.744988660@garbod26>
Source record: 105688
Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit,comp.sys.atari.st,alt.games.lynx

This is an updated list, thanks to all who replied. It still isn't accurate, if you feel you can make a contribution to it, please send me any information you've got or write a follow-up.

I've also received replies with some interesting information about Atari products that (to my knowledge) aren't widely known. I'll add them to the list later.

I'm doing this research in order to complete a dictionary on video games and home computers. It's written in Swedish, and it's only for fun, but I find the Atari stuff particularly interesting. That's the reason to why I posted this article and the original question.

I'll order the book recommended by some people in replies to the previous article, the book is called "The Rise and Fall of Atari", many thanks for this hint. But any observation done by people "out there" is still interesting, since it may bring up some undocumented facts, opinions etc on the subject.

Thanks in advance,
Anders Skelander

1972: The company, Atari Inc, is founded by Nolan Bushnell. Bushnell's intention was to use the name "Syzygy", but since it was already occupied, he picked "Atari" instead.
1972: ??? The Pong game becomes popular in the arcades.
197X: Pong is released as a home system.
197X: The Atari 2600 is released. The 2600 is based around MOSTEK's 6507 CPU, and offers a ??? * ??? pixel resolution and a, for the time of release, huge, 128 colour palette. Game size is typically 4 KB to 8 KB.
1978 ??? Atari release there first pinball machine.
1979: The Atari 400 and Atari 800 computers are released. They are 6502-based 1,74 MHz machines with graphics ranging from a 40 * 25 text mode up to 320 * 192 pixel graphics. In lower resolutions it's possible to use colours from a 128 colour palette, or even 256 colours simultaneously in a special mode. Audio is four-channel sound based on analog synthesis. The computers had inofficial names "Colleen" and "Candy".
1980: ??? The production of Atari pinball games is discontinued.
198X: ??? Nolan Bushnell sells Atari Inc to Warner Communications.
1982: The Atari 1200XL computer is introduced with specifications similar to the 800s, except that ???.
1983: The Atari 600XL and 800XL computers (the XL series) are introduced, with specifications similar to the 800's. XL replaces 400/800.

1984: Jack Tramiel leaves Commodore and buys Atari from Warner. Atari
is split into Atari Corp (consumer products) and Atari Games
(arcade games).
1985: The Atari 520ST computer is introduced. It's a 68000-based 8 MHz
computer with 512 KB RAM, graphics modes from 320 * 200 pixels
in 16 colours from a 512-colour palette up to 640 * 400 on a
monochrome monitor. Audio is created by a three channel sound
chip using fairly simple analog synthesis. Digital Research's
graphical user interface/operating system GEM is included. The
ST computer has a built-in MIDI interface.
The Atari XE series, compatible with the 400/800/XL series, is
introduced. (65XE, 130XE.)
1986: ??? The Atari 7800 is released. It can run 2600 games, but is
also a vast improvement over the 2600, with impressive video
capabilities in ??? colours and resolution up to ??? * ??? pixel
graphics. Sound is the same as in the 2600.
1987: ??? The Atari XE/GS video game, based on the Atari XE computer
series, is released. It can run old Atari 8-bit computer cartridges,
a few new games are released. A lightgun with some shooting games
are also released.
198X: ??? Atari buys the Lynx from Epyx. The Lynx is a 6502-based (4 MHz)
portable colour video game with a built-in 3.5" colour LCD
screen. Graphics resolution is 160 * 108 ??? pixels in 16 colours
out of a 4096 colour palette. Sound is four-channel mono. Lynx
cartridges can hold up to 256 KB ??? of code, the machine's
internal RAM size is 64KB. The Lynx has remarkable sprite
scaling capabilities.
198X: ??? The 68030-based 16 MHz Atari TT computer is introduced.
198X: ??? A portable ST computer named Stacy is introduced. It's
specifications are similar to the original 520ST computer. Stacy
has a built-in monochrome LCD screen.
198X: ??? A palmtop PC computer, the Atari Portfolio is released. The
Portfolio was developed by XXX in the UK.
198X: ??? The ST-Book (?) is introduced.
1989: The Atari STE series is introduced. The 520STE offers better
graphics hardware than the older ST computer, with hardware
scrolling and a coprocessor for copying chunks of data in
memory, a "blitter" chip. Audio is also enhanced with two-channel,
stereo, 8-bit PCM-sound.
1993: The 68030-based 16 MHz Atari Falcon computer is made available ???
to consumers.

This is a brief list of arcade games made by Atari/Atari Games:

1972: Pong
1976: ??? Breakout
1979: Asteroids
1981: ??? Missile Command
1981: ??? Tempest
1981: ??? Centipede
1983: Pole Position (developed by Namco)

(Question about converting tape commercial prgs. to disk).
Sometimes you can do it. Usually you can't or it is tedious.
Often, the tape prg. is protected. Often it loads over DOS and
won't work with disk without major finagling. I successfully
made 'KidGrid' run from disk. It was a simple one stage load
in memory that did not conflict with dos. Now my Bruce Lee tape,
that I messed with quite a bit. It was about a 6 stage load.
Over dos. Encryption. A mess. Only get those tapes if you want
to play with them. Chances are you won't be able to convert them
to disk.

It seems to be still existing, since my local dealer has some in demo...
The price was over 10 000 FF , but must have rose down since then...
Quite a bit :).
But it has never been really sold... Only interesting for musicians... They
had problems with power supply, as far as I remember...
The capabilities (and the interfaces) are the equivalent of a 4 Meg/48 Meg
STF (with TOS 1.04, though), with blitter.

>
>: 1989: The Atari STE series is introduced.

1991 ? 1992? : a notebook called St-Book is introduced:
at least 1 meg RAM, 2.5" Hard Disk, no internal Floppy (but interface)

At the same time a notepad (without a keyboard, but a pen screen) is anounced..
What did it become ?

I thought Atari Inc. was in Warner's hands most of the time. The "198X" figure strikes me as wrong. Didn't Nolan sell the company to Warner soon after Pong became popular? In any event, I think all 400/800 computers were released under Warner.

>>198X: Atari buys the Lynx from Epyx. The Lynx was developed by XXX.
>
> 1988-89??

Probably late 1988 or early 1989. The machine was nearly complete then; all Atari had to do was tool up the factories. The Lynx was officially released in New York and Los Angeles in December, 1989. I remember not seeing it in L.A. until three or four days before Christmas, which puts it in mid-December.

>>198X: The Atari TT computer is introduced.

It was a stock monochrome ST computer (1 or 4 megabytes of RAM, I believe) in a luggable case.

>>It would be nice to have the names and years of introduction of some
>>popular arcade games as well.

A quick search through the "Killer List of Video Games" (see rec.games.video.arcade) should turn up every title ever made.

> Yeah, what's AtariGames' relationship with Namco anyway?

Whatever it was, I think it's dead. Probably a distributorship deal more than anything else. I mean, until recently, all of Namco's games were carried by either Atari Inc./Atari Games (XEVIOUS, PAC-LAND, ASSAULT) or

Bally/Midway (PAC-MAN, MS. PAC-MAN, etc.). Only with the very recent stuff has Namco handled it on their own (SOLAVU).

I'd like to see an explicit listing of the agreement between Atari Games and Atari Inc., myself.

Does anyone know where i can buy/beg/borrow/steal cartridges for the now
defunct VCS 7800 as i have picked up a machine but cant find any cartridges
to buy.
I remember seeing a version of Galaxians/Galaga that looked pretty good but any other
classic Atari software would suffice...
eg. Centipede, Missile Command,Battlezone,Pacman,Star Raiders etc....

Hope someone can help..
Thanks,
Steve

That was kinda of a neat game. And one of the few that was better on PCs of the time than the Atari. It even works on PCs today, BUT its a tad to fast for my 486. :) First game that I ever saw with hard drive istallation.

[1] MOS Technologies was not the same as MOSTEK if I recall [common mistake]

[2] Horizontal resolution: 160 pixels
Vertical resolution: Standard NTSC non-interlaced [~220 on most sets]
Colors : Eight grays plus eight shades each of 15 hues

[3] CPU: MOS Technologies 6507 @1.19MHz [dot clock / 3]

[4] RAM: 128 bytes of RAM, mapped at $0080 and $0180

[5] ROM: 4K of address space available $F000 to $FFFF
[some cartridges bank-switch to get 8K, although this requires either
more chips or custom silicon. I am not aware of any carts bigger than 8K]

From: jim@skipjack
Message-ID: <1993Aug10.172516.10490@jpl-devvax.jpl.nasa.gov>
Source record: 105693

You might want to distinguish between the year a product was
announced and the year the product was actually available to consumers.
The two were usually different, especially after about 1985. :-)

2836. Looking for Spelunker

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-10 18:00:04 UTC
From: darreld@access.digex.net
Message-ID: <darreld.745005444@access>
Source record: 105695

Help, all. I'm looking for a copy of a game called Spelunker.
It was originally release by a company called Micrografix(I think)
and then repackaged and sold by Broderbund. Am interested in
either version. The older version had a neat intro screen
and played music from "Pictures in an Exhibition(?).

Any Help appreciated.

2837. Can I put files to 8bit from PC?

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-10 18:03:30 UTC
From: darreld@access.digex.net
Message-ID: <darreld.745005666@access>
Source record: 105696

Now that I have an Atari 8bit again, and have found out about the ftp sites for the 8-bit, is there any way to get files that are downloaded with a PC onto the atari? I currently have an extra 9600 baud modem but no 850 interface so I can't use a modem on the 8bit.

Has anyone written a utility that will read/write a PC disk in the 1050 drive? Is this possible??

It's possible - IF the 1050 has a doubler chip or other true double
density modification. There's a program for the PC which will quite
handily read and write Atari SSDD format disks (it's called UTIL I
believe) and should be available in the archives mentioned above.

Not even close. The KLOV is real nice, but it's full of holes, especially
in the early days. As a prime example, Ramtek, where I worked for a number
of years and which was for a while the number two video game producer, is
not mentioned in the KLOV at all - the same situation applies to several,
if not many, of Atari's earliest games. But then, so many of us who were
around this are suffering from senility by now :-)

This is not a joke. I'm looking for technical info and/or theory of operation info on the Atari 2600 VCS video game popular in the late 70's and early 80's.

If anybody has any information or can point me in the right direction, I'd appreciate it. I'd be particularly interested in the type of hardware used, memory maps and/or device maps.

Please reply via *e-mail* as I am unable to read this newsgroup on my server.

Around 1984-5 or so, Atari had publicised their Sara chip at the CES, which apparently contained 16K of ROM. Whether this was actually ever used in a published I don't know.

It is also worth noting that some cartridges also contained small amounts of RAM to suppliment the meagre 128 bytes in the RIOT chip. As there was no R/W line to the ROM, this was usually implemented by mapping the read for these locations to one address, and the write to another. Unfortunately, this also bit into the small 4K ROM space, which was tight enough already!

BTW, does anyone actually know what the mechanics of the commoner bank-switching schemes used on the VCS were? I've never actually found any information on this.

Ian.

Yes, indeed. Two players, two missles, the playfield, and the ball. There was a programmer's spec posted here awhile ago. I did not want to overburden the net with detail however.

Well, until Activision appeared, almost ALL games did their processing on every other scan line. After Activision appeared, almost all of them do it on every scan line. Also, I think Activision pioneered the hi-res six-digit scoring. Most games draw on about 180-200 lines, scanning every line except the old ones [Missle Command does some things every line; others things every other]

Almost all games used vertical resolution of 192-200 lines. Anything beyond that gets into the overscan region on some sets (especially older ones).

> Colors : Eight grays plus eight shades each of 15 hues

The last two hues were generally the same as the first two, giving an actual usable color space of about 104 colors. The PAL version of the chipset had fewer usable hues than the NTSC version did.

There were some carts bigger than 8K. I believe that Epyx' Winter Games was 16K.

The 2600 came out November 1977, and Warner bought Atari in 1976.
I got this from the book Zap! The Rise and Fall of Atari, by
Scott Cohen, McGraw Hill, 1984. The book covers everything up to
mid 1983, when Atari was beginning to shrink. I think Nolan
Bushnell left Atari in 1979.

>have doubts that it would be long enough. So if anyone has the pinouts for
>the monitor port and perhaps more details about building this cable, I'd
>appreciate it.... :-)

Okay, looking at the jack on the 130XE (or 800),
the pins are numbered as follows:

3 1
5 4
2

And the functions are:
1. Composite Luminance
2. Ground
3. Audio Output
4. Composite Video
5. Composite Chroma

This info can also be found in the book that came with the 130xe.

Buy the plug at Radio Shack or somewhere like that (5 pin DIN)
and get 2 RCA plugs, and connect pins 2 and 3 to one your audio
connector, and pins 2 and 4 to your video.

Hope this helps.

(I'm sending this to you in email too, but thought the net might be
interested)

- Frank

Hmmmm. I'm mentally running through the history of Atari Corp. (post-Warner, Jack Tramiel, et al), and I don't recall when they were ever rolling in the money. Uncle Jack came along, picked up the computer and home video game ends, and it's been pretty much hand-to-mouth the entire time...

Someone want to correct me on this?

2853. 6502 test program needed (atari emulator)

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-11 05:59:57 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1993Aug11.055957.13565@ultb.isc.rit.edu>
Source record: 105612

Well, it looks like I'm running into problems with the emulator
already, and they seem to be related to my 65C02 emulation.
Some programs work fine (even ones with lots of P/M graphics,
DLI's, POKEY timer IRQs, mixed graphics modes, fine scrolling, etc...)
and others lock right up or seem to get confused in ways that
suggest the CPU is at fault.

So, I was wondering, does anyone have, or know where I can get,
a program that will test out all the instructions of the 6502 or
65C02 and compare it against expected results? Or at least one
that comes with a list of the expected trace of it? (I can trace through
6502 code to see all the registers and memory read/writes, so if I just
had something to compare to, I could easily track this down)

Part of my problem might be the decimal mode for ADC and SBC-- I'm
unclear on what it does for numbers that aren't in proper BCD format
(i.e. - outside of the range 00-99) and how it affects the status flags.

But I'm sure that's not the main problem, because some programs that
don't work don't even use the decimal flag.

Also, I was wondering if someone might have the list of undocumented
6502 opcodes and their side effects (and does any Atari software use
them?) (for that matter, are the 65C02 instructions used? Did that chip
exist in the old 400/800 too, or just the XL/XE line?)

If you can answer any of these questions it would be greatly
appreciated.

If I have to, I'll dig out the 800 and hook it up and start playing
with MAC/65 and DDT and see if I can figure out what I should expect
from each instruction. (which could take a long time)

I *do* have some 65C02 spec sheets I found in an Apple book, but they
don't go into enough detail on exactly what side effects each
instruction has, and of course they don't give me the undocumented
opcodes.

Thanks for the help.

- Frank

(p.s. --- the color DEC 3000 (Alpha) workstation I've been doing this
on is going back to the computing department here tomorrow morning,
so from this point on I'll be developing this on a Tahoe machine (also
running Unix) with the Xwindows going to 4-gray-scale Kodak KIMS
workstations.... meaning that I won't be able to properly debug the

graphics and they'll be incredibly slow... so, maybe some better
optimizations will come out of this... but when I release this thing
don't expect the colors to necesarily be right... although I will
try to find a color machine to test it on at least once before sending
it off to the net)

2854. looking for that graphics program...

Newsgroup: comp.sys.atari.8bit

Message-ID: <1993Aug11.060637.13753@ultb.isc.rit.edu>
Source record: 105614

I remember a while back someone was talking about a graphics program
that used DLI's, P/M graphics, etc to get as many colors as possible
on a scanline. Is it available yet?
I'd like to get a copy to use to test my emulator-- because if it uses
these many tricks, it would be good to see how well I'm emulating the
real Atari, and how well I synchronized everything.

Just let me know where I can get it.
Thanks.

- Frank

>
On NTSC, at least on my machine, all hues are different; they work very nicely as a color wheel and since they are derived from progressively shifting the 3.58MHz clock, the hardware to implement them is cheap. I will grant, however, that adjacent hues tend to be very close; this is to be expected given that there are so many of them [15 hues is really quite a lot]. BTW, on my Atari the lightness values are noticeably non-linear: 3 and 4 are far more distinct than 2 and 3, or 4 and 5.

>There were some carts bigger than 8K. I believe that Epyx' Winter Games
>was 16K.

Hmm... California Games wouldn't surprise me at all if it were 16K [though I'd be disppointed--I gave them so much credit for 4 good events averaging 2K each... :-?] Winter Games didn't seem to have as much good stuff in it.

Are you sure you're thinking of 2600 carts? I didn't think Epyx ever
did a 2600 game - although they did lots of 400/800 games, some of which
might have shown up as 7800 games. At least, there were no 2600 games
in the works and no 2600 programmers at Epyx the last time I did work
for them, which was just after Summer Games came out.

Epyx made 400/800 carts with 16K long before this. My own game, Gateway
to Apshai, was 16K.

You did Gateway??? That was a really great game. I just wish it would let
you save your characters to disk! I hated to get down to level 6 and then
die... with no way to restart from level 5.

I believe the 400/800 have a plain 6502, while the XL/XE lines have Atari's
(slightly?) custom 6502C. I think the 65C02 is something else again, which
Atari did not build into any of the machines.

Can someone who knows what he's talking about elaborate?

You're right. The XL/XE lines's 6502C is not to be confused with the 65C02.
The 6502C is rather a plain 6502 with a different pinout. The instructions
should be 100% compatible. No 65C02 instructions are supported on the
6502C!!

I have solved the Journey to the Planets game. The screen you describe is
the one that gave me the most trouble also. Put the rock in the machine to
get the flat looking thing. The flat thing is a flying carpet which you must
use to fly over the canyon a few screens back. That should be enough
information to get you to solve the planet.

What is the other planet you are stuck on?

Yes, Epyx did a few 2600 carts... I have Winter Games and it clearly says 'Epyx'
on the cart and manual. That's not to say that they didn't contract the
carts out to some other company, tho.

If you look at Craig Pell's 2600 cart list, you'll see two or three Epyx
games.

Nope, I have (well, HAD i just sold it) Winter Games for the 2600 (not 7800)
which had scads of events and GREAT graphics for a 2600 game, I cant
say i know how much ROM was in it, but it had to be ALOT more then a
par 2600 game, the graphics were so good, and so many events

This is probably not documented. You will probably have to write some
test programs. However, I doubt this is the cause of your problems. Very
few programs would rely on this kind of behaviour. Even for numbers in a
valid BCD format, most of the status flags are invalid in decimal mode.
I believe that only the zero flag is valid. Check a few references.

> But I'm sure that's not the main problem, because some programs that
> don't work don't even use the decimal flag.

> them?) (for that matter, are the 65C02 instructions used? Did that chip
> exist in the old 400/800 too, or just the XL/XE line?)
>
All atari 8bits only had 6502 CPU's, with various pinouts. The 65C02 is not
supported in the 8bit, though some people have upgraded 400/800 machines
without problem. However, the timing of the 65C02 processor is different
for some instructions, and this can cause problems with timing loops and DLI
routines. I would emulate only the 6502, and not the 65C02.

Here is a list of 6502 undocumented opcodes I got off the net a while back:

Here's the 'undocumented OP codes' you
requested. I might add that some of
the programs I've seen also do stuff
like have the code pass an initial
start-up decremented by 1 so you can't
disassemble it from disk. The 1st piece
of code just INCs the rest so it'll run
From Compute May, 1987 by Raeto West

I would suggest you track down the book "Programming the 65816, including
the 6502, 65C02 and 65802" by David Eyes and Ron Lichty. This is an excellent
reference book. Also, I have a 8.5"x11" 6502 quick reference card made from
credit card plastic. Very handy. I lived by that thing when I used to
crack copy protection for the fun of it. Anyhow, I suggest you get one of
them. Last I remember, JDR Microdevices in San Jose sold them. They do
mail order business. Call information at (408) 555-1212 for their number.
If you can't find it, I could fax a copy to you...

Well, when you send it out, I'll run it on a HP 9000/720, and maybe on a
99Mhz 735. CPU cycles I got!

2872. Atari 2600 system etc. for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-11 18:43:01 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00970DDE.47327920@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 105634
Cross-posted to: misc.forsale,comp.sys.atari.8bit

The following items are for sale. You can buy any combination of items you want, no need to take everything if you don't want it.
Items will be sold to the best reasonable offer (if one is made :-), hopefully within a couple of days.
Please e-mail to address COHEN@GOMEZ.PHYS.VIRGINIA.EDU, or, in case you have no e-mail account, call (804) 293-8973 (prefer e-mail). Thanks!

Atari 2600 system and items for sale:

Atari 2600 in excellent condition, with manual

Black hard plastic protective hood that goes on top of the Atari 2600, with a place to put the cartridges and manuals on the top of it; it also allows joysticks and power supply cable to be connected, so the whole system can be conveniently operated with it

Atari joysticks

Atari paddles

Official Atari Log Book (like new)

A series of Atari catalogs from different dates.

A storage box for 24 cartridges (Atari 2600/5200/7800) or cassettes or even 8-track casettes if the need arises. Wooden base, smoked clear hard-plastic top, blue velvet-like inside.

CARTRIDGES-
Frogger
Home Run
Video Pinball
Astroblast
Outlaw
Super Challenge Baseball
Grand Prix
Moon Patrol
Space Invaders
Combat
Donkey Kong
Missile Command
River Raid
Atlantis
Fishing derby
Breakout
Super Breakout

Indy 500
Astroids
Pac Man
Freeway
Skiing
Football CX-2625
Target Fun 27 TeleGames
Pong/Sports 50 TeleGames

Please e-mail to address COHEN@GOMEZ.PHYS.VIRGINIA.EDU, or, in case you have no e-mail account, call (804) 293-8973 (prefer e-mail). Thanks!

2873. Gateway to Apshai!!??

2875. info on an 800XL with 1050 disk drive

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-11 19:23:58 UTC
From: arorabeck@TrentU.CA
Message-ID: <1993Aug11.192358.11299@trentu.ca>
Source record: 105633

Hello there! I found an Atari 800XL with a 1050 disk drive in my parent's house's basement: The same one I used to play games on when I was younger (including Infiltrator: I don't know how to do the second mission, either). I have a 486dx for my computing chores, and so was wondering where I could find info on everything on how the XL works (from the very basics up!), and what I could do with it. I know nothing at all about the system, so any pointers in the way of education from the computer's layout to interfacing would be greatly appreciated. My email is
arorabeck@trentu.ca
if someone wants to reach me there; I will continue reading the postings here too!!

Thanks a whole lot,
Andy

2876. 5200, anyone??

>>
>>Can someone who knows what he's talking about elaborate?
>
>You're right. The XL/XE lines's 6502C is not to be confused with the 65C02.
>The 6502C is rather a plain 6502 with a different pinout. The instructions
>should be 100% compatible. No 65C02 instructions are supported on the
>6502C!!
>

Hold on a second then.... if no 65C02 instructions are supported on
the 6502C, then why are they supported by the MAC/65 assembler
cartridge? Is that just in case you decide to plug one into
your machine instead of the traditional 6502?

And of course, my original question persists.... where can I find
out the info on the undocumented opcodes? I've already found some
demos that call opcodes that don't really seem to exist...
(to some extent they can probably be figured out by looking at
the addressing modes and other opcodes, but I'd like to be sure)

Thanks
- Frank

>to Apshai, was 16K.

Yes, I am sure. Epyx did several 2600 carts in 1987-1988. Those carts
were done for Atari, and marketed by Atari.

I worked as an employee for Epyx from November 1983-Feb 1987, and again
from November 1988-November 1990. You were never an employee at Epyx
during the time I was there, but I can certainly believe that you did
contract work for them around 1984. Actually, all but two of the
programmers at Epyx in 1984 were originally 2600 programmers (Epyx
merged with StarPath in November 1983), but Epyx was not doing any 2600
titles at that time. Epyx resurrected the old StarPath 2600
development systems for the Atari work.

Well, at least on the early 2600's (pre-1980), hues $e0-$ef and $f0-$ff
were generally the same as the hues $10-$1f and $20-$2f. The exact hues
changed several times over the years.

I was part of the Connelley Group, which consisted of the original
Epyx software group (minus one or two folks, notably Randy). We broke
off from Epyx proper around 1982, but continued to do contract work
for them through 1984 or so.

>Actually, all but two of the programmers at Epyx in 1984 were originally
>2600 programmers (Epyx merged with StarPath in November 1983)

I'd forgotten that. Makes a lot of sense, then.

Hello,
This is my first time to post on anything, so please be nice! I am selling
some games for a friend of mine for the Atari 2600 video game console.
Anyone who is interested please e-mail me at tim@rider.cactus.org.
The titles include:

PacMan
Strategy-X
Pole Position
E.T.
Mouse Trap
Combat
and a few others I don't quite have the name of.
I myself have quite a few games, so ask me if I've got whatever you're looking
for...

2885. Looking for ANTIC DMA cycle info (Atari Sim)

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-12 05:59:59 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1993Aug12.055959.13271@ultb.isc.rit.edu>
Source record: 105643

Yes, once again I'm posting for info for my Atari simulator.

This time, what I need is the info on how many cycles the DMA for ANTIC
uses for each video mode.
I know there are 114 machine cycles per scan line
(* 262 lines = 29868 per frame * 60 frames = 1,792,080 per second = 1.79Mhz)

What I need to know is, how many of those do you lose on each scanline?
Obviously blank entries in the display list shouldn't cost any cycles
(codes 0,16,32,48,64,80,96,and 112) although is there a one cycle
penalty for reading the actual entry?

(i.e. is it simply a penalty of the number of bytes the DMA must read,
and is each read one cycle, or what? Of course, if that's the case,
you'd lose 40 cycles on every mode 15 (Basic mode 8) line, and even more
in mode 2 (Basic mode 0) since in that mode you have to read the
character code plus every entry from the character set to draw it)

Or is it more complex than that, since the DMA reads don't always
conflict with CPU reads? If so, what's the average ratio of DMA data
amount to CPU cycles lost?

Also, on the text modes, does it read each character code once, and then
buffer them internally until all 8 (or 10 or 16) scan lines are drawn,
or does it keep looking them up on each scan line?
(40+8*40 penalty vs. 8*80 penalty)

Okay, so maybe I'm going into *too* much detail here, but I'm trying to
get the timing as close as possible so that there won't be as many
incompatability problems.

Oh, also, could someone with PAL info please give me the number of scan
lines and cycles per scan line, etc...? Assuming the same 1.79Mhz
clock frequency, and a similar horizontal refresh rate,
I'd guess the following:

50 cycles
314 scan lines
114 machine cycles per line (same as NTSC) ?
35841 cycles per frame

Am I correct?

Again, thanks for any help I can get.

And yes, I do intend to support PAL standards as well as NTSC.
Are there any others I should know of? Does Atari do SECAM? (and what
is it???)

Thanks.

- Frank

>
> - Frank

I'm hoping it will be ready tomorrow. All that is needed at this point is
disk I/O, and finishing a couple of sample pics.

I'll UUencode this, and send it to you.

It runs a fixed timing loop with no WSYNCs. Unless you are +/- zero cycles
in the emulation, it won't be in sync. On the other hand, if it works,
I'll be seriously impressed, and you should be able to run almost anything.
:-)

If I can think of some other things that aren't quite as nasty, I'll
include those too.

>unclear on what it does for numbers that aren't in proper BCD format
>(i.e. - outside of the range 00-99) and how it affects the status flags.

The BCD mode is really strange, in that the N,Z,V flags are not updated correctly. (I just found out about this from the 65816, but I don't exactly know what's wrong with them. Let me know if you need me to find out more.)

>But I'm sure that's not the main problem, because some programs that
>don't work don't even use the decimal flag.

I would agree that this is probably not the main problem.

>Also, I was wondering if someone might have the list of undocumented
>6502 opcodes and their side effects (and does any Atari software use
>them?) (for that matter, are the 65C02 instructions used? Did that chip
>exist in the old 400/800 too, or just the XL/XE line?)

As far as I know, undefined 6502 opcodes are unpredictable, and can crash the CPU. I would be really surprised to find actual stable uses for anything that wasn't listed in the 6502 specs. If there were other usable opcodes, wouldn't they have been listed?

Undefined opcodes could be used to purposely crash the machine in the case of copy protect failure. It's the best way, since it locks up the chip from most types of recovery.

No software should use any 65C02 instructions, since most of the Atari models can't even possibly use the 65C02. Only early models of the 400/800 used a standard 6502 that could be swapped for a 65C02. Later models and all XL/XE machines use a 6502C (note position of the C) that had some custom bus logic embedded in the CPU chip itself. No other processor can be swapped into those machines.

I wish I had a test program for you, but the only such program like that I have is only to test the assembly of every definable opcode and addressing mode. It does nothing, and uses the same operand value on each instruction. It's also expanded to a full 65816 set, although I could trim those out if this kind of thing would be any use to you.

It basically does:

```
ADC #$12
AND #$12
.
.
```

.

and goes through all instructions of all adr modes.

Nope, I have both Winter Games and Summer games for the 2600.
They really do exist. But I found them kinda lame. I perfered Activison's
Decathalon.

I downloaded the program called MULE which is supposed to
allow me to transfer 1 file at a time between the PC and my
800XL but It doesn't seem to work. Whenever I invoke MULE.EXE
on the PC (either under DOS 5.0 or OS/2's DOS) it just hangs.

Anyone having success with it?

I had a copy of that, might still have somewhere. It was a third
party thing. It was fast and worked alright but a lot of stuff I had wasn't
compatable so I want back to Smart DOS. It may have been that the compatability
problems were because I have a 'hotrod' 400 with Mosaic 64K ram and Rana system
disk drives.

BTW, if any one knows where I can get a tech manual for the Rana drives, pls
Email me. I tried the 800 number in the user manual a couple of years ago and
drive by their address and they are gone.

I have bought an ATARI 1027 Letter Quality Printer (very cheap).
As I have no ATARI Computer, nor any desctiption of the printer, I have not
yet found out how to make it print or even only react to Random-Commands.
Obviously the communication is seriel, but how does it work exactly?
Do the ATARI-peripheral-devices have device numbers (similar to C64)?
Perhaps someone can help me.

I think you must burn a cycle for reading each instruction in the display
list. You must also burn cycles to perform DRAM refresh. I'm not sure
how many cycles it takes, but ANTIC holds up the CPU about 4% of the time
doing memory refresh.

> (i.e. is it simply a penalty of the number of bytes the DMA must read,

True, BASIC mode 0 takes the most cycles of DMA.

> Or is it more complex than that, since the DMA reads don't always
> conflict with CPU reads? If so, what's the average ratio of DMA data
> amount to CPU cycles lost?
>
When ANTIC performs DMA, it stops the CPU clock, thus halting the CPU.
This is the reason that putting a 65802 in an Atari is non-trivial. The
maximum time the 65802 clock can be held high is limited, (I don't remember
the limit, but it is in the 65802 specs) and ANTIC will hold it longer than
that. This causes the 65802 to lock up. Unfortunately, the 65802 can have
its clock held low indefinately, but ANTIC stops it on the high cycle.
Terry Conklin (Terry, are you out there?) and I looked into this way back
in '86 or so.

> Also, on the text modes, does it read each character code once, and then
> buffer them internally until all 8 (or 10 or 16) scan lines are drawn,

> (40+8*40 penalty vs. 8*80 penalty)
>
I believe it only reads the character code once, and then reads the font data

as needed. Remember, in BASIC graphics mode 2, it only needs to read the font data once every two scan lines.

> Okay, so maybe I'm going into *too* much detail here, but I'm trying to
> get the timing as close as possible so that there won't be as many
> incompatability problems.

It is very important to get the timing accurate, since most DLI routines are coded down to the last available cycle.

I think the De Re Atari, and the Hardware Manual describe this is great detail. Call B&C Computervisions and order a copy if you don't have one.

Actually, it was incomplete. Namco bought Atari OPERATIONS, the
arcade-chain part of Atari. Namco is reasonably big as an operator in
japan, with some 60 odd percent of their business there being
operations.

John,

I think it can be done, but you have to have the skill of
a pirate to do so. Cassette programs begin loading into what ever
memory address is specified, EVEN PAGE SEVEN! This means that
professionally produced software will probably begin loading right
on top of dos, in page seven. You could probably write in macro
assembly a routine to get and put cassette blocks to file, later
edit it into a bootable disk, again loading into page seven at
boot.

I remember taking the rom image from basic and making it
bootable off cassette, along with a basic program. This was so I
could use a 400 and cassette to control and monitor the burning of
a woodburning furnace- back in Jimmy Carter days if I remember
correctly, or shortly thereafter. I know what you ask CAN be
done, just have to ask, why would you want to? There once was a
time when Jawbreaker and Pharoa's curse was staples on pirate BBS
all across this country. Is talking about pirate Atari 8-bit
software still taboo, even tho the computer is discontinued for
the most part within the United States? Would it still be illegal
for someone to upload these programs to the archive? I have seen
collections of over 480 different dos files, most of which were
games for the 8-bit Atari computers. Wouldn't it be grand if we
could trade these files legitimately?

I suppose I should be one to talk about how great it would
be, I still haven't dug my Atari out of the box its been sitting
in for the past MANY years. I don't even remember what Atari
graphics look like- don't think they match SVGA tho, maybe even
CGA was better. At least CGA was 80 columns in color.....sq

2901. Re: Looking for ANTIC DMA cycle info (Atari Sim)

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-13 08:56:29 UTC
From: jharris@cup.portal.com
Message-ID: <87819@cup.portal.com>
Source record: 105562

>This time, what I need is the info on how many cycles the DMA for ANTIC
>uses for each video mode.

I was just about to ask you if you handled this, since it is required for a
couple of the programs I was going to send.

>What I need to know is, how many of those do you lose on each scanline?
>Obviously blank entries in the display list shouldn't cost any cycles
>(codes 0,16,32,48,64,80,96,and 112) although is there a one cycle
>penalty for reading the actual entry?

Basically, you can figure one cycle for every byte DMAed, but there's also
up to nine cycles per scan line lost for memory refresh DMA.

You have 1 cycle for the display list fetch itself, except in cases where
you have an LMS address, in which case 3 cycles are lost. This cycle count
is only for the top scan line of any dlist instruction, and occurs in the
hblank period.

If PMGs are enabled, 5 cycles will be lost in the hblank period.

Memory refresh is nasty, because of the 9 cycles stolen, only 1 or 2 occur
in the hblank period. The rest occur during the first 1/3 or so of the
screen, and take place once every four cycles. On character mode screens,
only 1 cycle instead of 9 will be stolen, because of double DMA access.

Lastly, 1 cycle is stolen for every displayed byte. In character modes, 2
cycles per byte are stolen on the top scanline, and 1 per byte for the
remaining lines. The total amount of cycles will vary based on Narrow (32),
Normal (40), or Wide (48) playfields, and also with the wide playfield
created automatically when horizontal scrolling is enabled, which costs 4
extra cycles.

>Or is it more complex than that, since the DMA reads don't always
>conflict with CPU reads? If so, what's the average ratio of DMA data
>amount to CPU cycles lost?

DMA reads always conflict. It's consistant.

>Oh, also, could someone with PAL info please give me the number of scan
>lines and cycles per scan line, etc...? Assuming the same 1.79Mhz
>clock frequency, and a similar horizontal refresh rate,
>I'd guess the following:
>
>50 cycles
>314 scan lines
>114 machine cycles per line (same as NTSC) ?

>35841 cycles per frame

I think the PAL master clock is different. I know it requires a different crystal, and I know the POKEY timing values are all different. Yet, I also think that the same number of cycles per scan line in the same between NTSC and PAL.

>And yes, I do intend to support PAL standards as well as NTSC.
>Are there any others I should know of? Does Atari do SECAM? (and what
>is it???)

SECAM is available, but in a pretty small number of countries. I think the timing is compatable with PAL.

The Technical User Notes give the pixels/line and line decodes for PAL
as well as NTSC. My 800XL schematics show a parts substitution for PAL
machines: the 3.58 MHz crystal is replaced by a 4.43 MHz one, and a few
other parts are thrown in. Check these two documents for details.

> (Is MULE a hoax?)

One of the MS-DOS utilities that reads Atari 8bit disks will only work
if you have a really old PC/XT with a 180K single-sided low density
floppy drive. I don't know if that is MULE or not. I have never used
it. Doesn't it come with any documentation?

Come to think of it the utility that I am think of allows you to read
an Atari 8bit floppy while you are talking about transferring files
between two machines. Are you using a null modem? Are you sure it is
wired properly? I would double check all the connections.

2910. August AC

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-14 00:46:56 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9308140013.AA02095@smithkline.com>
Source record: 105569

[Lawrence, please post to all nets, thanks!]

This is to let AC readers know the status of the August issue.

The August AC is now finished, and the entire press run is in the hands of our Publisher. Under ordinary circumstances, the mailing would have already commenced by now.

However, a postal audit is scheduled for August 17, and the entire August press run must be held for examination by the postal authorities. So the mailing will be delayed until August 18 at the very earliest.

If this all sounds a bit mysterious, that's because the postal audit & all the voodoo that goes with it are just part of the rituals the post office imposes upon ANY publication that seeks to upgrade its mail service to 2nd Class. I can assure you, it has been a *tremendous* amount of work- & major headeaches- for both me and our Publisher. And it will probably result in a delay of our August mailing. So I'm going to ask all of AC's readers to be patient while I'm biting my nails awaiting the outcome of next week's audit.

Supplications to appropriate deities, burnt sacrifices to the Postal Gods, or prayers to the Great Cosmic Muffin in behalf of AC will be much appreciated at this time. Great labors were performed to prepare for this event, we have done our very best, & now we await Judgement From On High.

I can only hope AC will withstand the rigors of the audit.

I also wish I was better at waiting...

2912. Re: Undocumented 6502 OpCodes

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-14 07:37:10 UTC
From: jharris@cup.portal.com
Message-ID: <87876@cup.portal.com>
Source record: 105573

I tested a few items from that undocumented opcode list.

ANDX does what it says.

LDAX does load the A and X register, but not with the value in the operand field. For example, all operands from 01 to 03 placed $30 in both registers, while $04 resulted in a $06. I got a few other values, but don't know the pattern as to what to expect.

TSTA and TSTX did nothing that I could determine, other than increment the PC by 3. It didn't change any flags or registers, or the memory location.

That's as far as I went. We're apparently looking at strange paths though the micro-code.

Gosh, I wonder if anyone would actually use any of this in a real program.

John Harris - jharris@cup.portal.com

Sorry for posting this to a funny place. I'm getting nothing but errors posting to my own topic, and I just wanted to get this out. I hope the guy who wrote the front-end program I use can get the bugs out of usenet postings soon.

Phew,

I'm finally done with this graphic editor and documentation. All that remains is to finish up a sample picture, and a small tutorial. I realized that the concepts in this program may be difficult to grasp. The tutorial picture will show you how to control some of the effects.

Then I get to find out if I know how to upload FTP.

In the meantime, I've decided to post one of the included files, which is a technical description of the format, and of the quirks that come with it. I figured it may be enjoyable for many of you, and that I could start fielding questions about it. The learning curve may take a bit of time, so don't worry if you don't understand at first. Please ask questions.

Best Wishes,
John Harris - jharris@cup.portal.com

The GED graphic format is really in two parts -- player/missles (PMG), and playfield. For the playfield, there is a 10K DLI that continuously stuffs colors into the color registers. The background color isn't changed, but the other 3 color registers can be stuffed multiple times with different values. This creates 9 playfield colors per scan line. A color register value only exists for a portion of the scan line, and it creates what I call a color 'cell'. It divides the screen up into columns, as shown below, and I'll follow it with the DLI code. The scan line will begin with starting colors for all three registers. Next, the DLI pre-loads the first three color changes into A,X,Y. That takes us to pixel #27 on the horizontal scan line. From there, follow the chart below.

```
-- DLI instruction --
LDA # LDA #
STA $D016 STX $D017 STY $D018 STA $D016 STA $D017
```

```
-- X pixel coordinates --
31 63 83 107 131
1st set of ! New color 1 ! New cols ! New cols ! 3rd value ! 3rd val
colors 0-3 ! and original ! 1-2, and ! 1-3 ! for col 1 ! for 1-2
exist here ! 2-3 ! org 3 ! ! 2nd 2-3 ! 2nd 3
```

This is the timing of the DLI, but visually, It's more important to see where the color cells are, since that's what you draw with.

1st value of ! 2nd value of color 0 ! 3rd value of color 0 ! ! color 0

1st value of color 1 ! 2nd value of color 1 ! 3rd val ! ! of col 1

1st value of color 2 ! 2nd value of color 2

There is no 3rd value for color 2. I hope you can visualize what this does. It means that depending upon where the cursor is on the line, changing the color register value using the Shift-Arrows only changes the local color 'cell'. It will only change the color on part of the line. Playfield colors are stuffed automatically every line, and so changing a color cell effects only the scan line it is being changed on. The previous values will get stuffed back into the color register on subsequent lines, until those color cells are changed as well, (which can be done with the 'C' and 'W' commands).

The pixel positions in the chart are for the default setting. GED now allows you to skew the entire routine left or right, one cycle at a time. This will move all of the pixel coordinates.

```
--------------
| PMG Format |
--------------
```

GED has full control over all of the Atari graphic registers, but in a more limited fashion than it does with the playfield colors. There is only time in the DLI for one more register change. So for maximum flexibility, GED can set which register to change, as well as what value should be stored into it. This makes PMG changes behave differently than playfield color changes. Since PMG changes are not automatically stuffed every line, changing a PMG graphic register will effect every line from the cursor position down to the bottom of the screen, or to any other place where that register was changed further down the screen.

All PMG attributes have a starting value at the top of the screen. If the cursor is at the top when you give a GED command to adjust PMGs, the change will occur in this starting table, and you may change all of the attribute values in this way. (The Shift-Ctl-Up command is useful for getting to the top).

If the cursor is part way down the screen, any PMG commands will have to use the DLI routine which can only change one attribute at a time. If you enter another command on the same line, GED will look for the closest unused scan line above the position you requested. (By unused, I mean a scan line that does not contain a PMG register change -- it can contain playfield or PMG data.) The cursor will be repostioned to that line to let you know where the command was placed. If GED ran into the top of the screen, or a conflicting command before

finding an unused line, the screen will flash briefly, to let you know the command could not be stored. The cursor will be positioned at the conflicting position.

The problem you might run into, if you have any dense sections of register changes, is that by the time GED finds an unused line, it may be far enough above your cursor position that it effects other uses for a PMG object higher up. For example, lets say you have two small objects on the screen that you are trying to color with PMGs. These objects have one scan line of space between them. With the cursor at the top left of the lower object, you press 'Shift-1' to move the player to the new location. Then you use the Shift-Arrows to change it to a new color. Since this scan line was already used to store the position change, GED will use the blank line between the two objects. Now you decide that the second object needs to be larger, and you need to make the player wider to cover it. When you press '>' at this point, the closest line is at the bottom of the first object, and changing the player there may change the first object's appearance. When something like this happens, you may want to first press 'Shift-0' to erase this last register change. Then you need to examine the screen to see if there are any other ways to accomplish what you want. It may turn out that you don't need the extra width until a bit later in the object, and you can enter the width change partway down the object. There may also be no way to do what you need, and the only alternative is to switch to using a different object, or swap with one already in use.

There are other things you can do in tight spots, including editing or moving objects slightly to allow for a register change, or to cross to the other side of a playfield color cell boundary. One other option, is that if a new color change is relatively close to the previous value, and you can't perform the change exactly at the first pixel where you need the color, it may be completely unnoticable to just let the change occur where it can. People may not even see a few pixels of a different color. The MARTIAN picture had to do this once. Can you find the spot?

I hope that some of you will find GED a fascinating new approach to color graphics -- instead of a mess of confusion. I'm always available to answer questions.

This is speculation, but the above paragraph in reply makes a lot of sense, in that a 1.2 Meg drive is 80 track, and the Atari drive and older IBM PC drives were 40 track. I would suspect it should work fine with 360K drives, cannot think why the default head select would interfere with reading single sided floppies. If you do not have a 360 K drive in your PC, perhaps you could take the disk and software to a friend's house that does and try it? (<grin> or of course just add one from your collection of bare floppy drives in the cellar ... everyone must be like me and cannot pass up bare 360K drives for $10 at flea markets when they initially paid $300 for 180K ones years ago).

>

CGA? BETTER THAN ATARI GRAPHICS? Sorry, I beg to differ with you on this one. Yes, SVGA has better resolution and color, and in some cases EGA can be better, but CGA??? Never.
Granted, CGA could do up to 640x200, but with only two colors... and no real choice of colors. And in 320x200 you had four colors... four very bad colors. Now, the Atari had only 2 colors, per scan line, in 320x200, and only 4, per scan line, in 160x200, so you did have only half the horizontal resolution, but you could select from 128 (or in some cases, 256) colors, and you could automatically do horizontal and vertical fine scrolling, and could also overlay player/missile graphics over the background, adding additional color and high-speed animation. I've never seen the CGA come close, and most Atari programs have better gameplay than even anything I've seen in EGA and a lot of VGA. (yes, I know the last comment is going to get me flamed by someone out there who says they've got XXXX on the PC which is 1000x better than Atari... but it OUGHT to be. Think of the difference in cost and the time period during which it was developed.... The Atari hardware came out in 1979. What else compared to it at the time? I still happen to think that most games on it, using Atari-style joysticks, had better gameplay than most of what I've seen on the IBM, including a lot of the new programs, which *do* have incredible graphics now, but still have lousy gameplay in most cases-- remember how fast and responsive Star Raiders was? and it's just an 8K cartridge from 1979... where did all that programming skill go?)

Oh well, that's far more than my 2 cents, so I should stop now, and get back to my emulator.

And for the anxious: Please don't be too expectant of getting it this weekend--- I'm going to try to fix some major bugs tonight, and add a bit more functionality, but I don't have much time left before I have to pack to leave for Massachusetts, so it probably won't come out until I get back (two weeks). Thanks for waiting.

- Frank

2920. Wanted, White labeled Data Age Cartridges.

I just ran across a white label Data Age cartridge for the 2600. Obviously there must be more. I will try to make a good deal for them no matter how common the game is. Please e-mail me if you have any.... Thanks, Bill.

| G E M U L A T O R 3 . 0 |
| The Atari Emulation Card for PC Compatibles |
------------------------------------------------------------------------

[Windows 3.1 ] Last year we released Gemulator, the world's only Atari
[screen dump ] ST emulation card for DOS based PCs. With the freedom
[shows Gemul-] to run Atari ST software on a PC just about anywhere,
[ator running] over 500 Atari users just like you are already using
[Atari XE DOS] Gemulator on their PCs at home, at work, at school, and
[2.5 and Cal-] when they travel.
[amus SL. ]

Gemulator turns a PC into an AWESOME ST clone:
- TOS 2.06 ROMs included,
- 640x480 and 800x600 color graphics,
- 1.44 meg floppy disk support,
- modem, printer, and sound support,
- emulates up to 8 meg of RAM,
- Atari 800 emulation,
are all standard features of Gemulator. No need to buy a Falcon or spend
$$$ upgrading your ST!
------------------------------------------------------------------------
| Gemulator 3.0 will be on sale at the Glandale show, Sept.18-19, '93.|
------------------------------------------------------------------------
|Gemulator is fully compatible with: Pagestream, Calmus /
Highly |Calmus SL, MultiTOS, Geneva, Silhouette, Pha$ar,
Compatible |Word, Hotwire, Multidesk, Maxifile, GDOS/G+PLUS, Quick ST,
Emulation |Warp 9, Word Flair, EZ Calc, Sudden View, Laser C,
|ST Xformer, Magic Sac, Interlink, Avante Vector, Thunder,
|UIS III, Data Master, Turbo ST, NVDI, Extended Control
|Panel, Word Flair II, and hundreds of other Atari ST
|programs, utilities, and desk accessories.
|
|Gemulator requires only a basic 386 or 486SX PC. A new
Inexpensive|486SX system including VGA monitor and hard disk now costs
To Install |under $1200. So for under $1500 you have a 486 computer
|that's also an Atari ST clone with double the memory limit,
|double the screen resolution, and double the disk storage
|of a real ST! Just price yourself what it would cost to
|either upgrade your existing ST to TOS 2.06, VGA graphics,
|1.44 meg floppy, and 8 meg of RAM, or what it would cost
|you to buy the Falcon (if you can find one) and you'll see
|that Gemulator is a very sensible alternative to using an
```

Reviewed |ST. Product reviews in Current Notes (April 1993) and ST
|Informer (June 1993) agree.
|
|On fast 486 machines, Gemulator runs 2 to 3 times faster
Fast And |than the ST. That's as fast as the Falcon, and because
Powerful |Gemulator emulates the 68000 chip, not the TT's 68030 chip,
|Gemulator can run software that won't run on the TT or
|Falcon. For compatibility with ST software that does not
All TOSes |run on TOS 2.06, the Gemulator card allows you to plug in
|any earlier version of TOS. How easily can your ST switch
|between TOS 1.0, TOS 1.4, and TOS 2.06?
|
|Gemulator eliminates the need for having two monitors,
Graphics |since your PC's monitor can display all ST screen modes.
|The screen dump above shows Gemulator using a 640x480
|graphics mode, running Calamus SL under Windows. Gemulator
Sound |now supports sound by using your PC's Sound Blaster, Sound
|Blaster Pro, or AdLib sound cards.
|
|Gemulator gives your ST software access to the PC's hard
Hard Disk |disk. Use Atari's HDX utilities to autoboot from the hard
|disk. Create up to 4 32-megabyte ST partitions, or share
|files with PC programs on existing DOS partitions.
|
|Gemulator runs on laptop PCs, even color laptops, allowing
Laptop |you to use your favorite Atari ST software almost anywhere,
Ready |on smaller and lighter machines than the Atari STacy. All
|you need is a laptop with an 8-bit card slot.

The complete Gemulator 3.0 package lists for only $299 U.S. at an Atari
dealer near you, or contact Toad Computers, Rising Star, Floppy Wizard,
Xanth Computers, or PMC to order by
phone.
For a demo video, upgrade information, or more product information,

From:
B R A S O F T N E W S
The official newsletter of Branch Always Software. August 1993 issue.

Introducing Gemulator 3.0

If you have never seen Gemulator, picture this: You plug a small card into your PC. The card is the Gemulator ROM reader card which allows your PC to use the Atari ST's TOS ROM chips (TOS is the operating system which gives your ST the GEM interface). You then install the Gemulator emulation software into your PC's hard disk and run the emulator. In a few seconds, the familiar Atai ST desktop is up on the screen. Insert a disk, click on the A drive icon, and a window opens. You click on a program icon and in a few seconds you are running Atari ST software on your PC!

The whole Gemulator package, including the ROM reader card, a set of TOS 2.06 ROMs, and the emulation software (version 2.1) currently sells for $229 U.S. Without the ROMs, if you wish to use your own TOS ROMs, the package costs $179 U.S.

Gemulator 3.0, when introduced in September, will continue to sell for $229 with many new features added. If you are now a Gemulator user you can look forward to such new features as:

+ 800x600 16 color graphics and faster screen redraws
+ multiple ROM card and cartridge ROM support
+ sound (requires Sound Blaster or AdLib card)
+ hard disk autobooting and support for the HDX driver
+ modem support (using either COM1 or COM2)
+ Atari 800 emulation
+ numeric keypad support
+ more automated emulator configuration
+ improved compatibility
+ a new easy to read printed manual

And because Gemulator emulates the standard 68000 chip, the same microprocessor that's inside the ST, STE, and Mega ST computers, it can run Atari ST software that doesn't always run on 68030 based machines like the TT and Falcon and 68030 upgraded STs.

Gemulator 3.0 goes on sale in September.

How To Order The Demo Video and Upgrade To Gemulator 3.0

The Demo Video (on VHS tape) will be available in late September.
The cost is $20 and may be ordered by anybody.

Until September 3, 1993, all registered Gemulator users can upgrade to version 3.0 for only $30. We must have your registration card on file, so please send it in if you haven't
already. The upgrades will be sent out in early September prior to the Glendale show.

If you recently purchased or upgraded to Gemulator 2.1, i.e. after July 1, 1993, you are entitled to upgrade for only $10. Simply enclose a copy of the sales receipt from your dealer to show the date the product was purchased. After September 3, 1993, all upgrades will be $60.

Registered Gemulator users who require addition Gemulator ROM reader cards for use with the Gemulator 3.0 upgrade (to use with additional TOS ROMs or cartridge ROMs) may be ordered for $129 per card in addition to your upgrade fee.

All orders must be payable to Branch Always Software in U.S. funds by personal check or money order. Send payment to:

Brach Always Software, 14150 NE 20th St, Ste.302, Bellvue, WA 98007 USA

Shipping is free within Canada and the United States. Add $5 U.S per order for shipping anywhere else.

A U T H O R I Z E D G E M U L A T O R D E A L E R S

List price is $229 U.S. with TOS 2.06 ROMs. Prices in Europe may be slightly higher and vary due to flucuations in exchange rates.

>The GED graphic format is really in two parts -- player/missles (PMG),
>and playfield.
[snip]

Wow. This whole thing looks a real lot like the Spectrum format on the STs, which is almost directly analogous: changing the palette midway through the scan line. Plus, in this case, the PMG stuff. Only thing is, in the Spectrum program itself, you just act like you're drawing normally and the program handles all the technical stuff (like rearranging the palettes when you draw something new), and the various converters (GIF -> SPC, JPG -> SPC) automatically figure out "optimum" configurations of pixel values and palette settings. All that must take a load of computation, and I imagine the same type of thing on the GED format would be rather hairy to say the least. Well, good luck! I'll be interested to see your release package!

The only reason I wouldn't buy one is that it can't do MIDI. If it did
MIDI, I'd be happy. :)

(Add MIDI and you'd get a lot more sales)

Also, does it have HD support? Later in the post it says it does i think
for using PC HDs, but I'm not clear as to the difference....

Well... where's the MIDI support... didn't they realize that without supporting the accuracy of a normal ST's MIDI port structure that this GEMULATOR is doomed a quick death? No... trust me... it will die. MIDI makes up 90-95% of the market of the ST. Sure MIDIots will also play games and the such, but no MIDI? no way... it's a LOT cheaper to buy an STe w/8MB's and a monitor. A LOT. $600 for instance (used prices no doubt) max will get you a killer ST system.

Well, I never heard of STe's going to 8MB, but a 4MB STe can do a fair job
of MIDI sequencing provided you have a good program.

I guess if I were to spend the $2k I'd spend on my dream PC system, I'd
pay a little more to switch over to Cubase for Windows as well rather than
buy GEMulator for MIDI because I don't think it'd be as stable as running
a sequencer under its native environment.

One of the things I realized, is that I'm not planning to make GED a full drawing program. For my use, which is why the program exists, I only need to color an existing picture that I import from another source. Also, an automatic routine would make a lot of mistakes in GED's case, because it wouldn't know how large objects were eventually going to be when you started drawing them. That makes a big difference in deciding whether to use PMGs or not.

The routines in Atari ST Spectrum are much easier, because their format creates an even and identical color distribution on every line. With GED, the combinations of redefining PMGs including sizing and all, create very abstract situations -- which computers are not very efficient at solving. The bad part is, if the computer made some mistakes in allocating resources, it would be very nasty to clean up. Manual coloring, at this stage, is still the way to go.

On the other hand, converting an entire picture to GED format is a much easier job, because you know where all the colors are needed all at once. Someday, this will very likely be done.

John Harris - jharris@cup.portal.com

GED has just been uploaded to atari.archive in the directory
atari/8bit/New. This is my first FTP upload attempt, so please inform me
if it worked ok.

I think the TEST picture with 40 colors per line looks pretty nice. :-)

Enjoy,
John Harris - jharris@cup.portal.com

Yep... it worked fine for me.. The fa<t that it's simply a beta program
made to show off the fa<t that file xfer between a sto<k 1050 and a P@
drive may be the reason it isn't the best thing around! :) Well, it is
in fa<t the ONLY thing around that DOES it.. it just wasn't finished up
well enough. Damn, I forgot who wrote it. He's in @alif... I must
admit, for the time he spent (a week or so??!) and the hardware at hand
(an Atari sto<k 1050!) he sure made something nifty.

I'm just wondering myself, though, if there's any newer version that does
more than one file... or at least has a BIG buffer... not like 20-30k

> no doubt) max will get you a killer ST system.

Well... again, you must realize that this thing is still more or less in
an infan<y stage... at least I hope. I mean, hell.. plenty of times they
pointed out in the bro<hures that "su<h&su<h isn't supported... yet"
well, not "yet" but "in this version"

Let me see if I <an find out what it says about MIDI....

ahh shoot.. where'd it go? well . anyways.. this is the first version
(or so they seem to say) that supports ANY sound... soo.... :)

Well, xor... just wait another year :) ... maybe (hopefully) less

ps - it mentions about using it under Windows, straight MSDOS, and Unix.
What DOS do you use on you ma<hine, anyways?

MIDI makes up 90%+ of the Atari market? That sounds high to me, based
on the share of MIDI articles and software I see in the magazines and on
on-line services. What leads you to think that MIDI is such a dominant
influnce?

I love this game. Pulled it out last week. Then I realized I forgot how to
do the low jump. I know normal is just the button and high is the button
while you push up. Is low the button and push down?

>Boy, did we play that game a lot and if it hadn't been on cassette we would
>have played it even more.
>
>Did someone else have the same experiences with this game or is it just me.
>
Yep. My cousin used to spend summers at my house and we would play this and
other games for hours.

How do you protect a tape? I mean I know a fair amount about disk-based
protection but never heard of tape protection. Sounds interesting.

I have the following Atari 8-bit items for sale:

Accessories - 1 Suncom Tac-3 joystick $3
1 Atari 7800 joystick $3
1 set of paddles $5

Software on disk - Bank Street Music Writer $5
The Converter version 1.51 $5
Print Power $10
The Print Shop $15

Games on disk - Boulderdash Construction Set $10
Chessmaster 2000 $10
David's Midnight Magic $5
F-15 Strike Eagle $7
Hacker $7
Jewels of Darkness $5
Leaderboard Dual Pack $10
Master of the Lamps $7
MRCA Mach 2 $5
Pinball Construction Set $10
Quest of the Space Beagle (no docs) $3
Silicon Dreams $5
Trail Blazer $10

Books - Atari DOS 2.5 Manual, $7

If you are interested in any of the above please contact me...

....

In my opinion, mihocka has a real good thing going here. People
who need midi will pay to get it anyway. People who don't but who
admire the ease of use of GEM and the power of software like CAlamus
will gladly go for this. Let's face it... the 486 is more certain to
last than the the Atari, and is more easily available and serviceable.
Unless the falcon really takes off big, my way of upgrading from the
STs I own would not be to the Falcon. It might well be to a 486 and a
Gemulator so that my investment in files and software I love is
preserved.
The atari has always been able to do things no MessyDoss system can
do, and do it faster, smoother and more pleasantly. If I could now
get a cheap 486 and an emulator, I would have the best of both worlds.
The only thing I would miss would be the Spectre/GCR emulation. If I
were Small, I would join Mihocka on this one.

A 486 may be more serviceable, but what about the GEMulator board itself?
I'm looking at this in terms of a system purchase... will Mihocka be able
to support GEMulator for as long as ST/Falcon systems ship?

Will he continually provide upgrades? What type of upgrades does he offer
now?

And as small as Atari is, a 3rd party company like his is even smaller, so
getting support may be even more difficult.

Well, my own personal attitude is that when (not if!) i get a 486, I'm
going to buy all new software, and convert as much as I can to run under
whatever native OS I'm using on it. There may be a Falcon in my future, too,
simply for Direct-to-Disk recording... <it's cheaper than anything else i've
seen for the job>

2941. ATARI 1027 printer for use with PC???

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-16 11:08:26 UTC
From: kspeichl@x.cip.e-technik.uni-erlangen.de
Message-ID: <24npraEe62@uni-erlangen.de>
Source record: 105602

I have bought an ATARI 1027 typewriter (very cheap) but don't know how to use it. As I don't have an ATARI-computer, I can't even try if it's ok.
Does anyone know how the communication between an ATARI 400/600/800 and the peripheral devices works? It is obviously a serial bus wich connects the printer (and I suppose also the Diskdrive etc.) to the computer.
I guess that every component has its own device number. But what is it for the printer? And how works the transfer of data? Is a handshake signal needed?
I have fed the printer several hours with random numbers, but nothing happened.
What can I do?

Fortunately, Derek has a day job. :-) He works for MicroSoft, so
I don't think he is doing this for the money. He has been good
about support for his work for Atari in the past and I see no
reason why this should change. His company, Branch Always Software,
has developed other Atari ST products that have met with success
and been well supported.

This is fine for someone working full time in a high paying job. :-)
Not everyone is in that position yet, nor may they be for some time to
come. Those in college or with young families and a mortgage simply do
not have the resources to buy a $2000 computer plus that much or more in

software for it. Since we can't in good conscience recommend piracy, that leaves little choice for some.

Notice I am not directly recommending the GEMulator because I have not seen it run, but Dekek has a good track record and I think you would probably be happy with the product and the support including future upgrades.

Yes, it would indeed be grand. Unfortunately, there are still
vendors that sell 8-bit software (both new and used). Somehow,
they must still be making money and I'd hate to trample their
livelihood.

I'd love to see the 8-bit world cleaned-up, though. Some legitimate
software is next to impossible to find. Many original copy-protected
disks have gone flakey over the years, even though they may still be
sealed in the original box. I assume this is what the "Atari
Archives" project is all about? How about an update? (The Apple
equivalent, the "Lost Classics" project, seems to be making progress.)

No, the Atari Archive is simply a repository for freeware/shareware
software and text files (back issues of zmagazine, etc.). No copyright
material is accepted for inclusion (except for shareware programs with
copyright notices by the author).

I am curious about the Apple "Lost Classics" project. How is that being
handled? Is someone trying to contact the former companies/authors to
get a written authorization that releases these into the public domain?
I would like to see one person/organization/location take on the
responsibility of doing this. Maybe Atari Classics can run a page that
lists former copyrighted material that is now public domain. It needs to
be an organized effort.

I'm not convinced of that yet... so far, Darek's main products in the ST
market (correct me if I'm wrong) were Quick ST and the Atari 8-bit emulator.
The only serious commercial success he had was with Quick ST, which as
I understood, he licensed to CodeHead so he could devote his time to
working on GEMulator.

I think it is probably a fascinating piece of hardware, but I guess I'm
wondering how he is going to maintain GEMulator and how secure this
investment will be for 4-5 years from now. If Darek stops right now, I
would be able to run MIDI on it, and anything that hits hardware directly
(i.e., games) probably won't work.

I'm also thinking back on how the accident w/ Dave Small's son forced him to take time off from Gadgets to take care of family matters. I noticed we did not see a lot of SST030 and GCR expansions during that time.... and I think he has been shown to have excellent support for his users (at least the ones i've met). But things happen...

(basically, i'm leery of paying $300 for an emulator that can't quite mimic the whole 9-yards... with PC emulators for the Atari, we usually can emulate their ports... with GCR we can read/write Mac disks and even use our HDs as if we were a Mac.. i'd like to see the GEMulator in person to see if it is really doing what it claims...)

Zombies was the original. Realm of Impossibility was the sequel.
Both were awesome. Up there with Ali Baba and the Forty Thieves and
Boulderdash as my all-time favorites.

Tom

> influnce?

My experience in working with the ST for 5 years and seeing others in the
field. Games were popular in Europe, but in the states, aside from the
occasional pirate who had to have everything, I really never heard of
someone buying the ST for just playing games... The Amiga was better at
that... it starting coming down to music writing and playback. I mean,
the thing has built in MIDI ports... the only computer to do this as far
as I know... hense, there is a reason for that... Perhaps the 90% was
a bit high... but definately 80-85%... The ST just sucks for anything else.
The keyboard renders it useless for most business applications or word
processing. The mouse feels like shit, the graphics are so so, it's not
the fastest thing in the world... but for MIDI, it's perfect. I dunno...
it could be something I ate.

When writing to request catalogs,
it's always a good idea to include
a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing
a couple of International Reply Coupons (IRC's).

2953. Re: SURVEY: Favorite 8-Bit Programs

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-16 19:02:40 UTC
From: ed@Tekelec.Com
Message-ID: <1993Aug16.190240.1639@gecko.uucp>
Source record: 105514

It wasn't a cartridge game, but Infidel was a really good text adventure.
I managed to get the max number of points a few times through, but could never
avoid getting killed in the last room or when leaving it. Was there anything
else besides the mast from the ship to stand on when opening the door or to
put in the brackets to hold up the roof?

Eastern Front was also a good game. I don't think it was possible to
win above level 5 or so, the authors said this was on purpose so that you
could see just how futile it was for Hitler to invade Russia when he did.

Ed Campbell

Well, I dont know the te<hni<alities, but the Atari's OS has a table of
devi<e handlers... some loaded by the OS (ROMs), like @:assette,
P:rinter, E:ditor, K:eyboard, et<.. some booted or loaded, like
D:isk drive (DOS), R:S232 (usually modem), et<.

You <an always repla<e the handler, like was done with the E:ditor..
there's a repla<ement version out there that is a lot faster than the
OS-ROM one.

2956. printer for atari 400/800

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-16 21:13:56 UTC
From: cho@richsun.cpg.trs.reuter.com
Message-ID: <4552@richsun.cpg.trs.reuter.com>
Source record: 105517

For those of you scavenging for a printer for your atari 800 here's your chance to get a decent deal.

Seikosha GP-100 AT printer for the Atari 400/800.
This graphics printer plugs right into the port.
Price is $55. (shipping extra)

It works like new.

2957. Problem with Basketball on 1200XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-16 21:40:02 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9308162121.AA23853@smithkline.com>
Source record: 105515

I just completed all the electronic modifications for a dramatic improvement to the video output of the 1200XL (hopefully will have it written up in time for the December '93 issue of AC). With my mods the 1200XL becomes the best 8bit game machine, as the colors are more brilliant than video upgrades for the 600XL/800XL, while at the same time retaining the great improvement in sharpness & resolution of the upgrade I published in Current Notes awhile back.

I did a lot of testing & comparison with other upgraded XL's on this mod, paying particular attention to problems with color. I used a variety of cartridge-based games for the color testing. For some reason my Atari Basketball cart just would not boot in the 1200XL, tho it worked fine in the 800XL & 600XL. The 1200XL just came up dead, dark screen, no input response, etc. It ran sevral other cartridges just fine. Is there some incompatibility of Basketball with the 1200XL? Or, do I just have a funky cart? Or a funky 1200XL?

Anybody?????

2958. Atari SIO info for disk drive needed

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-16 21:41:38 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1993Aug16.214138.13490@ultb.isc.rit.edu>
Source record: 105516

I've been trying to build the reverse of the sio2pc hardware---
in other words, something to hook Atari peripherals up to my PC
(more particularly, the disk drives)
I successfully built a circuit that converts the RS-232 +/-12V
send/receive signals to 0/5V TTL data in/out signals for the Atari,
using line driver and receiver chips from Radio Shack.
I also use DTR to drive the "command" line. But, no matter
what I do, I cannot seem to get the drive to respond.
The packet I'm sending is: 31 53 00 00 84 (drive 1 status)
Shouldn't I be receiving something back? I tested the circuit, and
it responds correctly for converting the signals.

What I'm wondering, do I need to also supply the 5V and 12V signals to
the SIO port? I tried giving it 5, and also got no luck, but I'll
need another power supply to give it 12, since I'm only using 9 for my
RS232 driver right now. Also, does the drive perhaps need signals
on the proceed or clock in/out lines?

Then again, maybe the timing on the command line is more important than
I thought-- since I'm doing this under Unix, I just turn DTR on (which
drops the command line to 0V) and leave it on until my command is done,
but the timing isn't very precise.

If anyone knows exactly what the drive expects in the way of signals,
it would be greatly appreciated. (also, do I need to invert the signals
coming from the line drivers? The way it is now, +12V yields 0V, and
-12V yields 5V)

Thanks
- Frank

(email a response to me too, since I'm away right now and won't be able
to read this very often)

You may be looking for SDVert (something like that; the filename is SDV.COM or SDV40.COM).
I like it because it can convert between about 8 different formats, and it automatically senses which format your file is in-- just tell it what format you want it in. I don't remember if I found it on the archive or a local BBS, though.

(I didn't even know there WERE that many different text formats until I got this program!)

Per the Atari Hardware manual (I can't believe I found it, first try,
maybe next I'll find my schmativs for the interface I wired up) the
serial Clock Out line on pin 2 goes high at the start of each data out
bit and returns low in the middle of each bit. The Clock In line on pin
1 is not used. The Data in and Out lines I presume you are implementing
satisfactorily, remembering that a 4 volt or higher level is a logical
one and 0 v is logical zero. The Command- is normally high, and goes
low when a command frame is being sent from the computer Specs are typical

of TTL, 2 volts or greater are a one on input, .4 volts or lower a zero. Output, of course, open collector, and looks rated for 2.5 K total equivalent pullup (1.6 mA, 4.5-.4 volts) or 4 ten K loads, 8 20 K loads.

I suspect you do need the clock output.

Timing specs don't look critical. But .. they are .. 750 - 1600 uS from Command- to first command byte, 650-950 uS from last bit to Command- back to high. The peripheral is to acknowledge betweeen 0 uS and 16 mS. The computer can then send between 1000 uS and 1800 uS later.

Hope this helps, I hope someone is more expert than I if it isn't the clock output. If I remember correctly, I included a UART and such in my Computer/Tape drive interface so I could generate the clock signal (or perhaps I modified the UART in my 6809 box, I certainly need that schmatic!!!).

>
>What is the other planet you are stuck on?

It took me awhile to get back to this one.

Thanks for your help. I couldn't figure out what that object was, and
tried to do lots of things with it. You have to press fire and hold the
joystick up to get it to fly. Pretty cryptic.

The other planet I was stuck on is where you get a key to open a chest. I
have the chest on the screen. The key falls from the sky, but I can't pick
it up. I don't know how to unlock the chest.

You odds of a game working on GEMulator are infinitesimally small.

How can you expect a game to work on an emulator when 90% of them
don't even work on a TT, and heaps not on the MSTe!

GEMulator is for GEM applications only. Take a look at the list
of compatible software in the original posting.

Bollocks. Show me one program that will run on GEMulator but
not on a TT or Falcon. Only the most WELL BEHAVED programs
(which fortunately, are usually the good ones anyway) will
run on GEMulator.

#
#--
#James Hague
#exuhag@exu.ericsson.se

Well that really amounts to the same thing. The thing is, some people do
use these opcodes. They think they're being very clever - until
a replacement chip is brought out. I can't name any instances on the
Atari though I have seen it done one Appile][(6502 based). I have
also seen it done on mainframe processors.

O'course, if a compiler writer did it he would be ASKING for trouble!

Simon.

2966. 800XL,1050 etc. for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-17 13:01:46 UTC
From: gah@ccd.harris.com
Message-ID: <1993Aug17.130146.13831@ccd.harris.com>
Source record: 105530

For Sale:

800XL Computer
1050 Disk Drive
1027 Printer
1030 Modem
1010 Cassette
Koala Pad w/software(Micro illustrator and a game)
lots of software (games,finance,terminal,etc.)
lots of disks, cartridges, cassettes.
Almost everything is in the original box (except the disk drive)
most of the original documentation.

All for 125.00 or best offer

Or trade for IBM PC stuff i.e. Hard Drive, 9600 baud modem,
(4) 1Megx9 Simms.....

Make me an offer.

Thanks

As far as I've heard there is little that is less cumbersome than Cubase
for Windows. I wouldn't be surprised if it was faster and more reliable
when run through the GEM emulator. GEM is not that bad---it is fast
because it's simple. And, doesn't the GEMulator run without windows as
well?

My worry about emulators in general is that they are popular with the "gimme, gimme lotsa software" crowd. People always make a ruckus about, for example, Game Boy emulators for MS-DOS or X. I don't think they admire that handheld system, they just want to be able to get free games. I doubt this would affect Gemulator much (as it is not a free program), but unfortunately it might stir up interest in the forthcoming xatari program. (There have been problems in the past with illegal archives of Apple II software being available for ftp with the Apple II emulator for MS-DOS.)

I don't agree. As someone has stressed on this group before, people are
still happily using Ataris from 1985 but PCs from 1985 have all gone through
the shredder.

>Unless the falcon really takes off big, my way of upgrading from the
>STs I own would not be to the Falcon. It might well be to a 486 and a
>Gemulator so that my investment in files and software I love is

Guys, guys, what about the TT? If you'd buy a 486 and a TT now, I want
to bet you'll want to replace the 486 sooner than the TT. Same story for
Macintoshes. If there is any type computer that lasts *short* then it is
a DOS machine. (Note: MACHINE not SYSTEM).

2970. Atari Corporate History - 4

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-17 16:02:51 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.745603371@garbod26>
Source record: 105531
Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit,comp.sys.atari.st,alt.games.lynx

I've updated the the Atari corporate history list. As I've stated before, my intention is to write a dictionary (in Swedish) that covers important events in the history of video gaming and home computers. While I was doing this, I made a separate document describing Atari's history.

Btw, the emacs editor was about to destroy this revision of the list, I hit the keyboard by mistake and I may have damaged something. I can't find any error caused by this accident, but if there is something wrong with the list, I'll start using vi instead.

I've removed the arcade game list, and I haven't decided yet how to handle the description of the company after it was split. There may be a need for separate lists.

If you can complete the information, the times of certain events are still not accurate, I'll appreciate that. Reply on the net or via email.

1972: -Atari Inc, was founded by Nolan Bushnell. Originally, there was a company named "Syzygy" that both manufactured and operated games. This company was split, and a new manufacturing company was formed by Bushnell. Ted Dabney kept Syzygy's operations side and the name, Bushnell's new company was called "Atari".
1972: ???-The Pong game was released.
1974: ???-Pong was released as a home system.
1976: ??? -Nolan Bushnell sold Atari Inc to Warner Communications this year, but continued his work for the company.
1977: -The Atari 2600 was released. It was based on MOS Technologies' 6507 CPU running at 1.19 MHz. The 2600 offered a resolution of approximately 160 * 200 pixels and a 128 colour palette. It had 128 bytes of RAM, the ROM address space allowed cartridges up to 4 KB. Game sizes were typically 2 KB or 4 KB. Some cartridges used bank-switching for access to more than 4 KB ROM space, the biggest known games are 8 KB.
1978 ??? -Atari released there first pinball machine.
1979: -The Atari 400 and Atari 800 computers were released. They were 6502-based 1.74 MHz machines with several ANTIC (chip) graphics modes from a 40 * 25 text mode up to 320 * 192 pixel in monochrome. Using lower resolutions, it was possible to have 128 colours, or even 256, in a special CTIA (chip) mode. Audio was four-channel, based on analog synthesis in the POKEY chip. The computers had inofficial names "Colleen" and "Candy".
-Nolan Bushnell left Atari Inc.
???-The production of Atari pinball games was discontinued.
1982: -The Atari 1200XL computer was introduced with specifications similar

to the 800s, except that XXX.
-The Atari 1450XLD ??? was introduced with specifications similar to
the 800s. The 1450XLD had a built-in disk drive and XXX.
1983: -The Atari 600XL and 800XL computers (the XL series) are introduced,
with specifications similar to the 800's. XL replaces 400/800. The
800XL had 64 KB of RAM, the 600XL had 16 KB. The GTIA (graphics)
chip replaced CTIA, and among other things it offered better timing
for player/missile ("sprite") graphics.
-The Atari 7800, developed by GCC Corp, was shown at the Winter CES
in Chicago.
1984: -Jack Tramiel was forced to leave Commodore. He bought Atari from
Warner Communications. Atari Inc was split into Atari Corp (consumer
products) and Atari Games (arcade division). Amiga (a company) had a
deal with Atari, but it was inhibited at this time, and the Lorraine
(later Commodore Amiga) computer was bought by Commodore. The
AtariTel division was sold to a Japanese company, ??? Matsushita.
1984: ??? Atari announced their SARA chip at the CES, the new chip allowed
for 2600 titles with 16 KB of ROM memory.
1985: -The Atari 520ST computer was introduced. It's a 68000-based 8 MHz
computer with 512 KB RAM, graphics modes from 320 * 200 pixels
in 16 colours from a 512-colour palette, up to 640 * 400 on a
monochrome monitor. Audio is created by a three channel sound
chip using fairly simple analog synthesis. Digital Research's
graphical user interface/operating system GEM is included. The
ST computer has a built-in MIDI interface.
-The Atari XE series, 65XE and 130XE, compatible with the 400/800/XL
series, was introduced.
1985: ??? - The Atari 5200 video game was released. The 5200 was based on
existing XL (computer) technology.
1986: ??? -The Atari 7800 video game was released. It was 6502-based and
could run 2600 games, but it was also a vast improvement over the
2600, with impressive video capabilities in ??? colours and
??? * ??? pixel graphics. Sound was, however, the same as in the
2600.
1987: ??? -The Atari XE/GS video game, based on the Atari XE computer
series, was released. It could run old Atari 8-bit computer
cartridges, a few new games were also released. A lightgun with
some shooting games was released for the XE/GS.
1988: ??? -Atari bought the Lynx from Epyx, the company that also developed
it. The Lynx is a 6502-based (4 MHz) portable colour video game with
a built-in 3.5" colour LCD screen. Graphics resolution is
160 * 108 ??? pixels in 16 colours out of 4096. The graphics engine
supports scaling of objects. Sound is four-channel mono. Lynx
cartridges can hold up to 256 KB ??? of code, and the machine's
internal RAM size is 64 KB.
198X: ??? -The Mega ST series was introduced. It was based on ST
technology, but graphics handling was improved with a blitter chip.
198X: ??? -A palmtop PC computer, the Atari Portfolio is released. The
Portfolio was developed by XXX in the UK.
198X: ??? -The 68030-based 32 MHz Atari TT computer is introduced. Sound

and graphics are similar to the STE's, but there are also certain
improvements done in the graphics area. The TT's highest resolution
is 1280 * 960 pixels in monochrome.
198X: ??? -A portable ST computer named STacy is introduced. It's
specifications are similar to the original 520ST computer's. STacy
has a built-in monochrome LCD screen.
198X: ??? -A new version of the Lynx, "Lynx II", is released. The only
improvement (with regard to internal technology) over the old Lynx,
the "Lynx Classic", is that the headphone jack now features stereo
sound.
1984: -Jack Tramiel was forced to leave Commodore. He bought Atari from
Warner Communications. Atari Inc was split into Atari Corp (consumer
products) and Atari Games (arcade division). Amiga (a company) had a
deal with Atari, but it was inhibited at this time, and the Lorraine
(later Commodore Amiga) computer was bought by Commodore. The
AtariTel division was sold to a Japanese company, ??? Matsushita.
1984: ??? Atari announced their SARA chip at the CES, the new chip allowed
for 2600 titles with 16 KB of ROM memory.
1985: -The Atari 520ST computer was introduced. It's a 68000-based 8 MHz
computer with 512 KB RAM, graphics modes from 320 * 200 pixels
in 16 colours from a 512-colour palette, up to 640 * 400 on a
monochrome monitor. Audio is created by a three channel sound
chip using fairly simple analog synthesis. Digital Research's
graphical user interface/operating system GEM is included. The
ST computer has a built-in MIDI interface.
-The Atari XE series, 65XE and 130XE, compatible with the 400/800/XL
series, was introduced.
1985: ??? - The Atari 5200 video game was released. The 5200 was based on
existing XL (computer) technology.
1986: ??? -The Atari 7800 video game was released. It was 6502-based and
could run 2600 games, but it was also a vast improvement over the
2600, with impressive video capabilities in ??? colours and
??? * ??? pixel graphics. Sound was, however, the same as in the
2600.
1987: ??? -The Atari XE/GS video game, based on the Atari XE computer
series, was released. It could run old Atari 8-bit computer
cartridges, a few new games were also released. A lightgun with
some shooting games was released for the XE/GS.
1988: ??? -Atari bought the Lynx from Epyx, the company that also developed
it. The Lynx is a 6502-based (4 MHz) portable colour video game with
a built-in 3.5" colour LCD screen. Graphics resolution is
160 * 108 ??? pixels in 16 colours out of 4096. The graphics engine
supports scaling of objects. Sound is four-channel mono. Lynx
cartridges can hold up to 256 KB ??? of code, and the machine's
internal RAM size is 64 KB.
198X: ??? -The Mega ST series was introduced. It was based on ST
technology, but graphics handling was improved with a blitter chip.
198X: ??? -A palmtop PC computer, the Atari Portfolio is released. The
Portfolio was developed by XXX in the UK.
198X: ??? -The 68030-based 32 MHz Atari TT computer is introduced. Sound

and graphics are similar to the STE's, but there are also certain
improvements done in the graphics area. The TT's highest resolution
is 1280 * 960 pixels in monochrome.
198X: ??? -A portable ST computer named STacy is introduced. It's
specifications are similar to the original 520ST computer's. STacy
has a built-in monochrome LCD screen.
198X: ??? -A new version of the Lynx, "Lynx II", is released. The only
improvement (with regard to internal technology) over the old Lynx,
the "Lynx Classic", is that the headphone jack now features stereo
sound.

2971. 2600 composite output?

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-17 16:44:06 UTC
From: spacek@cactus.org
Message-ID: <1993Aug17.164406.11314@cactus.org>
Source record: 105533

I have a 2600 VCS. I recently rescued it from the garage for my son to play with. OK, and for me to, :-) Anyway, hooking it up to the actively used color TVs is causing a lot of conflict. I have an old black and white one I could hook it up to. I also have an old composite color monitor. It occured to me that might be able to add composite and sound outputs. Should be able to just install a couple of extra RCA jacks on the back and hook them up. But I'm no electronics wiz and might screw it up. So, I thought I'd ask if either 1) There -is- an electronics wiz out there who could tell me how to do it or 2) Maybe plans to do it exist somewhere or someone else has already done it and knows how. If not, I'll probably attempt it myself anyway. I think the signals needed should be there. Just have to pick them up before the modulator. But it might not be as simple as just hooking it up. There might be some minor circuitry I should add? Hopefully nothing major. I would think anything drastic would be required. Anyway, any info would be appreciated. It would allow me to hook it up in my son's room with a color monitor and no doubt result in a better picture. Also. I noticed that the player one joystick works fine. But the player 2 one always thinks that you are pulling the joystick back towards you whether you in addition to the direction that you really have it. It's not the joystick, I've tried several. And it nothing seemed to be shorting on the 2600 board that I could see. I guess some part on the board has failed. Either something minor or possibly the 6532 RIOT chip. Wonder how much a new 6532 costs? Have to call around and see. Swapping it out would be easy to do. If it didn't work, then I could look for something else failing. Anyway....

Mark....

Source record: 105543

In my opinion, there are NO compatibility problems between DOS 3 and DOS 2/2.5. Those arguments are old saws that everyone has believed about DOS 3.

The "problem" with DOS 3 was that because everyone was so used to DOS 2, they could not adapt to the way DOS 3 handled things.

I switched to DOS 3 when I got my first 1050, bought 2.5 in 1985 and was not impressed, so I converted everything back to DOS 3. In all of my files, there was not a single instance where a program that ran under DOS 2 would not run under DOS 3. In fact, DOS 3 freed up a bit more RAM, although these days, that few k of memory is nothing.

I have DOS 4, and yes, it is a most complete DOS, but due to the RAM of Ataris then, it is more like MS-DOS in that it is a disk-based DOS, utility programs are loaded from disk, rather than being resident in RAM, like the utilities are in DOS 2. That means that DOS 4 is a pain for those with only one drive. By the way, DOS 3 also works better in multi-drive systems, with the master disk in D1, and programs in D2 and D3.

I tended to collect DOSes, and the ones I have are:
DOS 2.0S, DOS 2.0D, DOS 3, DOS 4, Rana DOS, SmartDO6.1, MachDOS 2.1, DOS 2.11, and the odd Long John Silver DOS.

>because it's simple. And, doesn't the GEMulator run without windows as
>well?

GEMulator does not (currently) support MIDI... therein lies the problem...

So the only options for MIDI sequencing if you buy one is/:

1) By a PC sequencer and port all your old files over
2) Continue to use your current ST in conjunction with the PC

So it seems (from my MIDIot point of view) to be a bad move for me... i can
see where a DTP user might want to migrate, as DTP is:

1) heavily GEM based
2) not timing critical
3) and usually can take advantage of new screen modes

Source record: 105536

BRiTiSH,

SDX should uses the last bank in nearly any memory configuration. On a stock 130XE, the bank select bits of PORTB should be 11 (I think). On a 256k 800xl (RAMbo), such as mine, it also seems to use the top bank. I guess it would look something like this:

```
|-----------|
|SDX ram 16k|
|-----------|
| Extended |
~ ram ~
| |
|-----------|
| lower 64k |
|-----------|
```

The Idea was to alow 130XE compatibility on machines with <128k.

re 4.19 ROMs: I have the SDX 4.19 ROM from when I 'upgraded' to 4.20.
Let me know if you are interested.

>get a written authorization that releases these into the public domain?
>I would like to see one person/organization/location take on the
>responsibility of doing this.

Yes, that's how the Lost Classics project works. Ever so slowly,
authors are contacted, old software is cleaned-up (copy protection
removed, etc.), and the programs are released as freeware. Off the
top of my head I know that most of Bill Budge's old Apple software
has been successfully processed and released as freeware--*including*
source code. There are others as well, but I can't think of specific
titles.

I'm not sure how this effort is organized. Time permitting, it
would be a fun thing to work on. I realize, though, that it would
take LOTS of time to do properly. I'm going to ask someone in
the know about the Apple project how things are handled.

No. The 5200 was much earlier than 85. I got mine the winter of 82. I am almost certain. (Or was it winter 83? At the very latest.... They were combatting the recently released ColecoVision console) I sold mine so I can't look at the date on the pc board.

The 1450XLD, if I am not mistaken, also had a built in 300 baud modem and a speech synthesizer... The 1400XL was supposed to have a 300 baud modem and speech synthesizer, but no disk drive...

>1985: ??? - The Atari 5200 video game was released. The 5200 was based on
> existing XL (computer) technology.

Uh, no... the 5200 came out in mid-late 1982... I got one in the summer of 1983 (Back when Super Breakout came with it! ;) And the base system is a 400 computer with no keyboard..

>198X: ??? -The Mega ST series was introduced. It was based on ST

This was 1987... TOS 1.2 was made for the Mega's and it has a date of 1987 on it..

>198X: ??? -A palmtop PC computer, the Atari Portfolio is released. The
> Portfolio was developed by XXX in the UK.

88-89? It was developed, I believe, by a company called DIP (The MS-Dos clone was called DipDos...)... I may be wrong there, but it was a short name LIKE Dip, if nothing else...

>198X: ??? -The 68030-based 32 MHz Atari TT computer is introduced. Sound

This was 1991 I think... Also, the system includes a backlight on/off switch,
which extends battery time...

Hope this helps! Feel free to dispute me!

```
**********************************
*** Atari MegaSTe 4/50 for sale ***
**********************************

16MHz 68000 cpu
4Mb RAM
50Mb internal hard disk drive
one 3.5 inch internal floppy drive
one 3.5 inch external floppy drive
separate programmable keyboard
VME expansion port
SC1224 color monitor
SM124 mono monitor
mouse and all cables, manuals, etc.
200+ disks of PD/shareware software w/storage boxes
Plus some commercial software (email for info)

Got to make room for some new hardware and in order to maintain marital
bliss, at least one of my Atari computer systems _has_ to go.

Overall, this system has proven to be very reliable and it provides a
considerable performance increase over a standard 8MHz STe. In many ways,
I find it preferable to the Falcon030... it's nearly as fast, easier to
expand, much more compatible with existing software and has an excellent
keyboard (all IMHO, of course).

I will consider all serious and reasonable offers. Payment can be
arranged a number of ways to include cashiers check, money order, cash
COD, or even M/C or Visa if you prefer.

If interested, forward your questions and/or reasonable offers to me
via email at hutch@ilmen.lanl.gov and I will get back to you. Or you may
phone me at (505)665-3665 (days) or (505)662-7236 (evenings), MST.

I have in front of me the December 1982 issue of 'Videogaming Illustrated'. Page 9, under the title 'The Emperor Strikes Back' they write: '...this is the month the long-awaited Atari 5200 goes on sale. Retailing for $299, the unit offers graphics which are comparable to those of Intellivision and Colecovision, and sound effects to match.' The article also mentions that games are expected to cost from $31.95 to $39.95.

I think I heard previously on the net that 1985 was the *last* year that the 5200 was made.

BTW I have a few issues of 'Videogaming Illustrated' which sometime in 1983 became 'Videogaming and Computergaming Illustrated'. The articles are interesting and seem well-written. One of their reviews raps Decathalon for being too hard on joysticks :-) Anyone know what became of this magazine or if it still exists in some mutated form?

I thought that SDX might handle it that way. (using the highest ram_bank number for its 16k area) Now as to the ROMs, what is the highest version number of SDX available, and also, what are the advantages (bug fixes etc) of the various ROMs? I'm currently using 4.18 and only heard of 4.19, while I have also heard that there is a 4.21 version out there.

Thanks,

Unlikely, but true. What happened was that it was developed and shown by
Atari (under Warner Bros.) but when Tramial bought Atari, he decided to
concentrate on the computer market and so shelved the 7800. After the
video game market made a bit of a comeback, Tramial decided to release the
7800 after all. They had a boatload of them anyway and he thought it might
be a way to make some quick money. I doubt seriously that Tramial ever
thought that they would go over very big or last very long, but he decided
to spend just enough money to try to move their inventory.

They are both mail order houses. If you write to Video Magic,
send $2 for a nice little catalog. Note that both these vendors
primarily sell games (for lots of systems in addition to the 8-bit
line).

>run on GEMulator.

There are probably plenty of them. There are pieces of code that will break on '030s due to caches, MOVE SR, and stack frames at least. Maybe more. If these programs are well behaved in other respects, they would probably work on GEMulator.

These instances obviously won't be as popular as the programs that don't work on GEMulator, but they will exist.

I have a U-Print A printer interface which I no longer need. This has a SIO cable with plug on one end, a ribbom cable with standard Centronics printer connector on the other, and a SIO socket in the box itself (so you can daisy chain your other peripherals).

$30 takes it - you pay shipping, -or- trade me something.

This is not true.

There is a program called UTIL which works just fine, and is not a
cobbled-together demo by any stretch.

Someone posted earlier wondering why such a program would fail on a
1.2Mb floppy. The answer lies in the size of the gap in the read/write
head for a 1.2Mb drive - because 1.2s have 80 tracks in the space a
180K/360K drive has 40, the tracks must be narrower (thus the head gap
must also be narrower). Lower density drives often have problems reading
data written by high denisty, narrow-gap heads. When transferring data
between a PC and an 8-bit, it's best to use a 360K drive.

I do not have much experience transferring files to my 8-bit. I am using HOMETERM and a 1030 modem. How do I get files from a DEC machine (it has kermit on it) to my 8-bit? I now that this is probably a stupid question but I just recently pulled out my 8-bit from the closet and I seem to have forgotten everything about it. I would like to get back to using it and I have seen quite a few interesting programs listed in the atari.archive. Remember, I am just getting back to using my 8-bit and I was never a highly involved user to begin with.

All help is GREATLY appreciated!

I'm sure UTIL was once, as you say, "A cobbled-together demo". But UTIL still has many problems, it will not work on anything less than a double dens. 1050 nor anything bigger than a 360k on the IBM side. MULE, however, will work on a stock 1050, and so long as the disk is formated to 180k on the IBM side, it does work on a 1.2m drive. I've moved files between my stock 1050 and my IBM many times without problem. Yeah, MULE does have a number of drawbacks, limited files size and only being able to move one file per disk, but it is as stated, only a demo. Too often people will jump and yell about how something "Can't be done". While you make good points about the differences between the drives, it does not mean we should get rid of the program. UTIL and MULE have the same failings for the same reason. What we should learn from this is, all our systems are different. What works on mine may not work on yours, and there are other programs to try (provided you have double density drives and either MyDos or SpartaDos). For me, MULE works. For Bill Kendrick, MULE works. Maybe the person who posted the orinigal message didn't format his IBM disk as a 180k disk...I don't know. But the system does, in fact, work. With a little more work, the exiting bugs and limitation can be worked out and MULE could become just useful as UTIL, SpartaRead and IBM2AT.

Ok, so is GEMulator able to run stock TOS programs or is it devoted to GEM applications? I think Darek's safest assumption is that well-behaved GEM apps would work on his emulator, but those programs are usually the ons that work on every machine.

The catch here is that when he runs things like non-GEM apps that bang the hardware, and it isn't there, i don't see where he will gain much more compatiblity, and the programs he may be running.. well... they are probably old enough that i'd do better to buy an old 1040ST for $75 (less than half the cost of GEMulator) and hook it up to my old SC1224 i have sitting around here unused, and run the program....

If I recall, HOMETERM won't do Kermit, but there are several terminal
programs on the various archives that will. You will have to find an
archive that has some of the more capable terminal programs in a form
that you can download with HOMETERM (assuming that is the only comm
program you have). I used to move files to/from a VAX using Kermit,
but I don't remember which comm. program I used on the Atari. I do remember
that some were a lot harder to use than others.

(It might be easier to get someone to mail you a disk which has a
good program on it all ready to run, rather than trying to bootstrap
yourself up to all the comm. and unARC programs you may really need.)

I've never had problems with UTIL, except it can't seem to
format an Atari disk that my XF551 can read. If I format
on the Atari, no problem. (this on 1.2m 5.25" drive). The format
problems may just be the machine I have.

And remember to use the _binary_ option when necessary. It also
seems to slow down ALOT when reading/writing the outer tracks,
but no big problem.

Actually, I *do* have a good reason for this. I want my
Atari emulator (which currently runs (mostly) in Xwindows, but will
later be ported to do things like VGA graphics directly, as well as
whatever else people might feel like interfacing it to) to be able
to read Atari disks directly. Yes, I know there is software for PC's
to do that for double density disks, but what about all the single
density disks that need to be booted directly to run? And what about
non-PC users who would like to be able to read their software into
whatever machine they're running the Atari emulator on?
That's why I'm trying to come up with a simple hardware circuit for
interfacing the SIO to any 19200 baud RS232 port. Also, in theory
this would let you talk to any other Atari peripheral-- printer, modem,
etc, although I can't think of any that would be useful except the disk
drive (unless you wanted to boot casette software or something)

With the right software, this would even allow you save copies
of copy-protected software on your hard-drive, to later be loaded either
by a real Atari interfaced by the SIO2PC interface, or by the emulator.
What you would need to do was make the interface allow the RS232 to
monitor the SIO activity of the Atari hooked up to a real drive, and
then save the data that the Atari expects to a file.

My end goal is to build something that can:
1) Allow the RS232 to act as an Atari, thus taking
command of peripherals
2) Switch over to acting like a peripheral, so that another
Atari hooked up to it can use it to boot off of
(the same concept as the SIO2PC which uses the harddrive
as a giant floppy disk)
3) Just sit passively and monitor the line, allowing the RS232
to see all data that goes both ways (or at least allow
the selection of which line to monitor, since both
would require 38400 throughput and something to buffer
the data)

Unfortunately, all my hardware experience is just projects I've built
before by myself--- this year will be the first that I really take
any hardware courses (I'm a CS major), so I'm not sure if I have
the experience needed to build this yet.

(although I did successfully build a circuit I can plug Atari cartridges into to read them from an EPROM burner)

Again, any info will be appreciated.
- Frank

(and I'm still away in Massachusetts, doing this over dialup, so the emulator will have to wait another 1.5 weeks)

>problems may just be the machine I have.

Actually UTIL works fine with SOME 1.2m 5.25" drives. Among some 10 or so
1.2m drives at our computer center I found 2 or 3 doing the job well.
The others will format the disk in a way my upgraded 1050 can't access.
I guess it's an alignment problem on the 1.2m drives.

Of course if I want to be 100% sure my data will be readable on the Atari
I prefer using those old 360K drives together with UTIL.

WH>
WH> BTW, Cris Crawford is the one who wrote this game, that's
WH> probably why he was showing it off on that show.

Actually, the nuclear power plant simulation game was one of a class
of simulations evolving from "Hammurabi" which attempted to employ a more
real-world situation for its scenario. I recall at this time there were
all sorts of "managment" simulations written in BASIC that were making the
rounds. There were simulations for running electric companys. There were
simulations for running television stations. There were even simulations
for running the U.S. economy. Also, there were many, many variations on
Hammurabi, such as Dartmouth's "KINGDOM" and games like "Dukedom",
"Medieval World", etc. The variations were endless!

"SCRAM!" is the name of the ATARI program, but if you do some digging
around you will probably find some other versions as well. I recall a
program listing called "The PET Nuclear Power Plant" for the Commodore PET
that appeared in COMPUTE! (or was it CREATIVE COMPUTING?) magazine which is
a BASIC listing that predates SCRAM! I seem to remember an OHIO CHALLENGER
(or was it a TI99) version also. In fact, any school lab that had a color
terminal like a RAMTEK usually had a "nuclear powerplant meltdown graphics
demo" just so they could demonstrate impressive color changes and screen
tricks. I think that this was shortly after the Jane Fonda film "The China

Syndrome" was released (that is, I can't think of another reason why there were so many of these demos... perhaps the demos inspired the movie and I have it backwards? Hmm....)

I had forgotten all about that! I think the 7800 was originally
"Video System X," though. The original press blurbs (much like
the Jaguar nonsense now) mentioned that it would be 2600 compatible
and cited graphics capabilities that were beyond those of the 5200.
They also mentioned sound capabilities that never made it into the
7800. I have an early rumor report somehwere around here, I think.

>So who wants to explain the following: on the 5200 Galaxian box, the
>copyright date is 1986 atari. On the same box, it says trak-ball
>compatible (available in august 1983). So which is in error? I'm sure
>the trak-ball did come out in 1983, but why is the copyright date 1986?
>Wasn't galaxian one of the first available cartridges?

An interesting question is "When did Atari give up on the 5200?" I know
they didn't stop supporting it until Jan 1, 1992, but after the crash
both the 5200 and ColecoVision disappeared *fast*. Were any 5200 games
released after 1984?

Even without MIDI support the GEMulator is still useful for music. My wife has been using an ATARI 1040ST for sequencing and transcribing for several years now. Unfortunately, transcription often uses more disk space and memory than the ATARI has. My wife still uses the ATARI for sequencing, but it was much more cost efficient to purchase a GEMulator and perform all transciption on the PC. I already had a 486DX-33 so for a nominal investment in the GEMulator, I can continue to use my ATARI software without having to invest more money into a computer that has a shakey future at best (no flames please!).

In case anyone cares, I have been using the version 2.1 of the GEMulator and found the emulation to be exceptional, even software that talks to the hardware often works flawlessly. Even games usually work as long as they are not copy protected (and even some of them will work) and they only require a mouse (no joystick emulation yet). As far as 8-bit support I can't say anything at this time; until 3.0 came out, the emulator would not run. However, I have used the 8-bit emulator on the ST and it works great with the exception of player missile graphics.

That is one of the nice things about machine code interpreters - it is
possible to intercept writes to hardware. It is possible to make a Gemulator
that is more compatable than any ST.

>probably old enough that i'd do better to buy an old 1040ST for $75 (less than

I think idea is that you can save desk space if you use a PC anyway, and
you can use all the PC's facilities (Large hard disk drive, XGA display, fast
processor).

We have already reached the stage where the Gemulator can be faster than a
standard ST, and it won't be long before it is as fast as a TT.

In a way, the Gemulator is a cool hack. But I also have this
irrational part of me that hates to see a nifty machine with some
character get absorbed into a desktop business box. This taints
my opinions of most emulators.

But this always will occur at the cost of speed. Personally, I'd like to
see one in person, but there are some things I'd like to see, like how it
deals with running ST applications under Windows. I've seen some impressive
screen shots of Calamus running in an ST window under Windows. But I'm
also wondering how fast it goes. I find life pretty painfully slow
using a 16mhz Mega at times, and I believe a 486-33 delivered (roughly)
the performance of one of these machines. Does anyone have the specs on
what type of PC would be comparable (with emulation) would be comparable
to what type of ST?

>We have already reached the stage where the Gemulator can be faster than a

>
>- Leo

Well, if you have a Pentium machine... :)

Actually, one thing I'm wondering about is why Darek has not made an
attempt to also get GEMulator to become a Mac emulator for the PC. The
ST's hardware should be much more difficult to emulate, and he could
probably create something comparable to Spectre GCR based on the
board he has now for GEMulator. It'd be nice if for $600 a user could
have a GEMulator and a MACulator up and running.

I must disagree. MULE is the ONLY pei<e of software that works with a STO@K (1.5 density) Atari 1050 drive! I pointed that out in my previous post. I'm not aware of ANYthing that works with old 810's (single density), but UTIL and some others(?) work with Happy'd and US-Doubled drives as well as all the other DOUBLE-density (180k) Atari drives.

A sto<k 1050 only does about 127-128k!!!

From: craig.s.thom@genie.geis.com
Message-ID: <9308200159.AA03871@relay2.geis.com>
Source record: 105430

The last version of SDX released was 4.20. There is an ATARIDOS.SYS newer than
the one in the cartridge available for download from the ICD BBS, GEnie, and
CompuServe. This ATARIDOS.SYS fixes a bug when copying a file two an AtariDOS
format disk AFTER copying a file bigger than 64K on the same format disk.
The rest of this is from memory that is fading. I BELIEVE the change from 4.19
to 4.20 was a new X.COM and a change in the format routine to switch back to the
ROM character set.
I don't think 4.18 has the XEP80 handler, either. I'm sure there are other changes, but I
can't remember them. ICD has
an errata sheet they ship with the ROM upgrade.

Not quite so Bill, a good friend of mine, Pab Sungenis, still writes many good things in TBXL. Look at PabQwk and PabMail as well as Mboard2000.

TBXL is far from a dead language... in fact, I like programing in it almost as much as I like programing in in Action!. TBXL handles strings better (IMO). I use to do a lot of TBXL work in Analogs LBasic... produce all the code on TextPro with out line numbers.

Anyway, Take care

From: Chris_F_Chiesa@cup.portal.com
Message-ID: <88410@cup.portal.com>
Source record: 105432

I was able to use my 2600 on a composite video monitor after about two minutes of fiddling around with clip leads. I figured it out by trial and error. First I hooked up a RCA cable to my monitor's composite-video input jack, then connected clipwires to the dangling end of the cable, and connected/clipped the "shield" side to a likely-looking ground point in the 2600. Then I simply touched the "signal" side clip to various points in the region of the RF shield (might've opened it up, I don't recall) until I got a picture. (A similar technique will also give you the audio signal.) I ran entirely off clipwires but you could easily solder a new jack or two to the points you find.

This is the empirical method; others may prefer to actually go in armed with specific instructions! :-)

I just spotted your response re the SDX.

By the tone of your message, is it safe to assume you don't work for ICD these days?

I seem to recall that you are the programmer that wrote the patch to allow AtariWriter Plus to run under SDX. Nice piece of coding.

I further patched the software to enable people to use the Reset key to exit AW+. I had to put a routine at the bottom the stack which permitted AW+ to do a reset ONCE to start itself, then redirect the vector back to SDX. The details are fuzzy now.

What are you up to these days?

> ST and it works great with the exception of player missile graphics.
>

No Player-Missle graphi<s? Well that sux! ;) Oh well.. it supposedly
only emulates the 800, not the XL/XE. Does it do ANY graphi<s (ie, the
@TIA or GTIA <hip modes? (GTIA is @TIA + the 16 <olor and grey modes))

Is it any faster? Hmmm... hehe... maybe I <ould do better graphi<s
rendering and NLQ font dumping if it were faster..

hehe.. but I'd need $1500+ for it... :) haha!

Hehe.. God, I'm really getting to like Daisy Dot fonts and utilities! :)

So far, I've made the following little programs that handle DD3 files:

DD3VieW - Views a DD3 or DDII font on a gr.8 s<reen
DD3@Lo<k - Loads up the 0-9 <hara<ters from a DD3 or DDII font
and makes a ni<e <lo<k out of it.
DDSHOw - It's a lot like PP.@OM in that it understands DD3
@ommands, but it doesn't DO mu<h with them.. it lets
you proofread a DD3 text file without having to keep
tra<k of underlines, "\"s, et<. It lets you view the
text with or without @ommands present... ie

\FTIMES\\RAugust 20, 1993

would look either like

<TIMES\>[rght]August 20, 1993
-------------- (underlined shows inverse)

or simply:

August 20, 1993

VERY ni<e... I might even work on an editor that "hides" the DD3
@ommands, so you <an proofread AS you write!

At the moment, these little programs are simply @OM_RUN externals in
TurboBASI@ XL, but are easily translated into both .@OM and .TBS
(TurboBASI@) stand-alones.

Ni<e! I am also going to work on a true print-previewer and font
shrinker (makes the DD3 fonts smaller to save disk spa<e and for more
data on the s<reen)

If you dont have DD3, then GET IT! PD demos are around and the reg.
vers. is $25 from

Try SpartaDos X! That is by far the best DOS I have ever found on the 8 bits. I haven't used my 8 bit for a long while, so I dont know if it is still available. (Probably is).

It is very similar to SpartaDos xxx (forgot the version, its been a while). But SpartaDos X is on cartridge, so it does not use up much memory. Also, it has a blisteringly fast ARC program in it. (Honestly, close to the speed of ARC on an ST! - of course it is hard to compare. Most 8 bit files are significantly smaller than ST files).

Oh, ya the Portfolio was released in '89..winter I belive. I remember
reading about it in the WaldenSoftware ComputerBytes (Or something like that)
newsletter back then.

The 1450XLD sounds AWESOME! I wish I read more magazines back then.
I had a Commodore 64, but I infrequently only bought Commodore magazines
and Amiga magazines from '85 on... didn't really start reading mags a lot
until '89 or so. I missed out on a lot. I used to think my c64 was the
greatest 8 bitter... I bought an Atari800XL a few years ago, and it
surprised me! Built in 300 baud modem and a speech synthesizer? Wow!
How much did it go for?!

>Well... where's the MIDI support... didn't they realize that without
>supporting the accuracy of a normal ST's MIDI port structure that
>this GEMULATOR is doomed a quick death? No... trust me... it will die.
>MIDI makes up 90-95% of the market of the ST. Sure MIDIots will also
>play games and the such, but no MIDI? no way... it's a LOT cheaper to
>buy an STe w/8MB's and a monitor. A LOT. $600 for instance (used prices
>no doubt) max will get you a killer ST system.

I challenge you to come up with this "$600 killer ST system". I suppose
you can MultiTOS on this system? Or Calamus SL? All on a $600 system?
Used prices, no doubt. Fire sale prices, no doubt. A used ST with a couple
meg of RAM sells for $300 to $400. Add a hard disk, a couple of monitors,
and you're still under $600? Bull!!!!! New prices you're looking at $1500
for such a system, and you can buy a brand new 486/33 with hard disk and
SuperVGA monitor and Gemulator for $1500. So economically it costs the
same to buy just an ST, or a PC with ST emulation. A PC emulator for the
ST will put you out hundreds more and not even provide 486 emulation.

Also, claiming that MIDI is 90%-95% of the MIDI market is more bullshit.
What you meant to say was that 90%-95% of the Atari ST market doesn't
give a damn about MIDI. It's a niche market and there's very little demand
for it, thus it was never added to Gemulator. Most people did not buy an
ST for its MIDI capabilities. If you dispute that, then explain to me why
MIDI is not discussed in 95% of comp.sys.atari.st messages?

This is not a flame mail, I'm just pointing out that you really don't know
much the product. Send me a mailing address and I'll send you more info.

Source record: 105440

Atari 2600/7800 cartridges FOR SALE:
(All cartridges are BRAND NEW in factory boxes w/manuals unless otherwise noted. Multiple quantities available unless indicated w/a (1).)

2600 Video Game Cartridges-

$1 EACH titles:

Desert Falcon *No manual or box* (1)

$2 EACH titles:

Asteroids, Battlezone (1), Centipede, Circus Atari, Crystal Castles (1), Galaxian, Gravitar, Jr. Pac Man, Kangaroo, Ms. Pac Man, Missile Command (1), Moon Patrol (1), Pole Position, Realsports Baseball (1), Realsports Football (1), Realsports Tennis (1), Realsports Volleyball, Secret Quest (1), Solaris (1), Space Invaders, Super Breakout (1), Super Football (1)

7800 Video Game Cartridges-

$1.25 each titles:

Karateka *No Manual or box* (1)

$2.50 each titles:

Ballblazer, Barnyard Blaster (requires Atari Light Gun) (1), Centipede, Choplifter!, Crack'ed, Crossbow (requires Atari Light Gun), Dig Dug (1), Donkey Kong, Donkey Kong Junior (1), Food Fight, Galaga (1), Hat Trick, Jinks, One-On-One Basketball, Pole Position II, Realsports Baseball (1), Robotron 2084, Touchdown Football (1), Tower Toppler (1), Xenophobe (1), Xevious

If interested in any of these cartridges, contact Lawrence Estep at 524 Roseview Terrace, New Albany, IN 47150, by CompuServe Mail at 71450,1050 or Internet at 71450.1050@COMPUSERVE.COM, or call (812) 948-6278.

Minimum order charge is $5. Price includes shipping charges. All orders will be shipped via U.S. Postal Service. This list was updated on 8/20/93. Please call or e-mail if possible to confirm availability of the titles you are interested in before mailing payment. New titles may have been added or titles may have sold out since this list was printed.

From: craig.s.thom@genie.geis.com
Message-ID: <9308210430.AA09023@relay2.geis.com>
Source record: 105442

I called ICD today (I still know a few people there ;-) to check on this. There has not been a new version of SDX in the last year (I would have been shocked if there had been). Either my memory has failed in a BIG way (age could do this), or you got the wrong sticker on your ROM. This is possible, since one of the Amiga ROMs is apparently at 4.21. If you get the chance, I'd be interested to see if the ATARIDOS.SYS in your ROM and the disk-based one are identical, not just sizes, but byte-for-byte.

>I guess it's an alignment problem on the 1.2m drives.
>

Did you use blank, _bulk erased_ disks? A lot of new disks, and
certainly an old disks, are already formatted, and hence have data
on them that may not be completely erased with the 1.2 meg drives
narrower trach heads. If you have accesse to a bulk eraser designed
for video tapes, try using it to be certain the disk is erased before
trying to format and use it in the 1.2 meg drive, and trying to read the
data on a 40 track drive. Sometimes this can help.

>Of course if I want to be 100% sure my data will be readable on the Atari
>I prefer using those old 360K drives together with UTIL.

Mike Cookson, whose Internet address Portal doesn't include for me here,
and who doesn't include it himself in a .signature file, writes:

> Try SpartaDos X! ...I dont know if it is still available. (Probably is).

ICD, makers of SpartaDOS X, stopped supporting the Atari 8-bit a year or
so (maybe longer; time flies) ago. I presume there are no "new" SDX carts
to be had at this time, and that you'd have to settle for a used one. I
myself would love to get v4.20, having currently only v4.19.

>Also, it has a blisteringly fast ARC program in it. (Honestly,
>close to the speed of ARC on an ST! - of course it is hard to compare.
>Most 8 bit files are significantly smaller than ST files).

The scuttlebutt on SpartaDOS X's ARC program is that it has some bugs
and that you should use Bob Puff's SuperARC and SuperUNARC instead.

I have a clean Atari 600xl system for sale, asking $20 plus
shipping. Includes the computer, two Atari 2600 joysticks, power
supply, cable box, video cable, and Star Raiders cartridge.
Please email. Thanks.

Yes... I for one am GLAD to see it here, for otherwise I would not have
known about it. Not only can he contact anyone interested here (into
UPGRADING to St/IBM) but he can look for hack support too.

3046. Text Processors please!!!

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-22 05:35:05 UTC
From: maestro@cybernet.cse.fau.edu
Message-ID: <7c6N9B2w165w@cybernet.cse.fau.edu>
Source record: 105456

I have a vrey large problem. I have a 256K (RAMbo upgraded) 1200XL Atari and I need a text processor that will allow me to work on files that are considerably larger than 18K (the limit I've run into so far), say to as much as my RAM will allow.

This is needed since the node I call sometimes gets noise and I must get a UUEncoded file page by page (hence, plenty of "[more, q=quit]" in the text).

If no processor is available, is there a file that will split large files into smaller ones? (And then join them together of coursE) I am aware of SPLIT.COM which doesn't work, or perhaps I have an old version of it.

Any help appreciated.

3047. k65src size

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-22 11:41:05 UTC
From: kenth@carson.u.washington.edu
Message-ID: <257m0h$khm@news.u.washington.edu>
Source record: 105457

I've just ftp'd k65src.arc from the umich archive. However the size is 240+ kbytes. I can't figure out a way to either download it or unarc it, as I only have a DD 1050 for my atari. Thus I can't play with anything bigger than 180 kbytes. Is there by chance a program on a unix box that will handle the arc format? I've tried ar and zcat but they don't work. Thanks for the help.

kenth@u.washington.edu

3048. Re: k65src size

>handle the arc format? I've tried ar and zcat but they don't work. Thanks for
>the help.

Have you tried 'arc -x k65src.arc' under your unix? If that doesnt work, then
you'll have to ftp the code to arc521e from wuarchive in the /mirrors/unix
directory (I think) and then once you untar-and-feather it, just type
'make arc' and it'll install the arc program. If you ask really nicely
your SysAdmin might even install it when they have time.

3049. GED and J. Harris

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-22 14:49:25 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <25811l$ioh@usenet.INS.CWRU.Edu>
Source record: 105460

I want to say that I appreciate John Harris's GED and dialog on this SIG. He might like some intellegent questions and feedback. I briefly looked at the Martian and have a small understanding for the difficulty of putting more than one color on a scan line. The only question I have is a 10k DLI. That's impossible. A DLI only has time for about 20 instructions at most. And the GED.COM is only 3600 bytes. How can there be a 10k DLI?

3050. WANTED: Atari Disk Drives

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-22 22:13:59 UTC
From: totty@flute.cs.uiuc.edu
Message-ID: <CC6LrB.63o@cs.uiuc.edu>
Source record: 105461

Someone posted recently (I believe in this group) about having Atari 8-bit disk drives (1050, Indus, etc.) for sale. I might be interested in making a purchase, but unfortunately, the article seems to have expired.

If the poster reads this please reply, or if someone still has the article, please send me a copy!

Also, if you have affordable Atari disk drives for sale in very good condition, please let me know!

Thanks for all the help,

--- Brian

3051. WANTED: Atari 800, 48K, GTIA, Prefer Thumbscrews!

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-22 22:33:05 UTC
From: totty@flute.cs.uiuc.edu
Message-ID: <CC6Mn6.73y@cs.uiuc.edu>
Source record: 105462

I've been trying to find at Atari 800 to replace the one I stupidly sold about 8 years ago (man, I loved that machine!) I would like to get the exact same model if possible, but I have not been able to find this model in several years of gradual searching.

I am looking for an 800, with GTIA chip, 48K RAM, and with the *thumbscrew* latches on the memory access compartment. I purchased an 800 last year with machine screws instead of thumbscrews, but I'd really like to get the thumbscrew version for nostalgia's sake. Anyone have one of these in very good->excellent condition they want to sell me?

If you have the above, but without the thumbscrew latches, tell me anyway, I might be convinced to buy one anyway, if I give up my goal as too ambitious.

Take Care,

--- Brian

Here's the current list of people's favorite Atari 8-bit programs as sent to me. I haven't checked the list in detail, and am not familiar with certain programs, so please report any errors/duplications/etc. to me. Also, if your favorite programs are not on the list, please send them to me. If there's enough interest, we can vote on this list later, to determine the favorite comp.sys.atari.8bit program.

Take Care, --- Brian

>

:)

Write something like this in BASI@ or TBXL (all "@"s mean "see"
<hara<ters... I'm on a flakey dumb terminal..)

```
5 DIM A$(100) - plenty of room for a uue'd text file!
10 OPEN #1,4,0,"D:SOUR@E.TXT" - open sour<e for input
20 OPEN #2,8,0,"D:DEST.TXT" - open destination for output
30 TRAP 100
40 INPUT #1,A$
50 IF A$<>"[more]" THEN PRINT #2,A$ - output to dest ONLY if it's
not a "[more]" or whatever..
60 GOTO 40
100 @LOSE #1:@LOSE #2 - @lose files..end of file (or some error)
has o<<ured
```

anyways... you @ould also do something like this is you have multiple
files:

```
5 DIM A$(100)
7 OPEN #2,8,0,"D:BIGDEST.TXT"
10 READ A$:IF A$="-" THEN @LOSE #2:END
15 @LOSE #1:OPEN #1,4,0,A$
20 TRAP 50
30 INPUT #1,A$:IF A$<>"whatever" THEN PRINT #2;A$
40 GOTO 20
50 @LOSE #1:GOTO 10
60 DATA sour<e1,sour<e2,sour<e3,et<,-
the "-" marks end of "sour<e list"
```

What this does is lets you append a bun<h of files (listed in true form
(with "D:" and whatnot) in line 60 after the "DATA", with the "-" at the
end.. all separated by ","s!) ... anyways, it appends them together to
the file listed in quotes on line 7.

:) simple simple simple! ;) not the qui<kest, but ni<ely automated..

of <ourse, the "IF" is all going to depend on things like what the
"[more]" looks like, EXA@TLY (well, if you <an program you <an figure it

all out if things are different at different pla<es or whatever)

sheesh.. :) just have fun. :)

Here's the instructions I picked up somewhere on the net.

Sorry for the wasted Bandwidth, but it has come to my attention that
there is a typo in the textfile I released. Everything will work fine
if you hook it up as per the schematic [visual] BUT! One of the
resistors was labeled wrong. It was the correct resistor, just wrong
number. Nope, it would'nt cause any damage, you just wouldn't get a
picture. 8-)

The following has been corrected.

Sorry for any inconvenience this may have caused,

Thomas

----------NEW TEXTFILE BELOW----------

COMPOSITE/AUDIO/CHROMA/LUMA OUTPUT FOR ATARI 2600 by THOMAS CLANCY

File revision 1.1

After finding my entertainment budget disappear (poor university student) I
was forced to economize--I dusted off the Ole'2600. I figured I would hook
it up to my computer monitor, but to my dismay there was no composite output
on the beast (Atari). Determined to overcome, I quickly disassembled it.
After some poking and prodding around I managed to locate the required
signals.

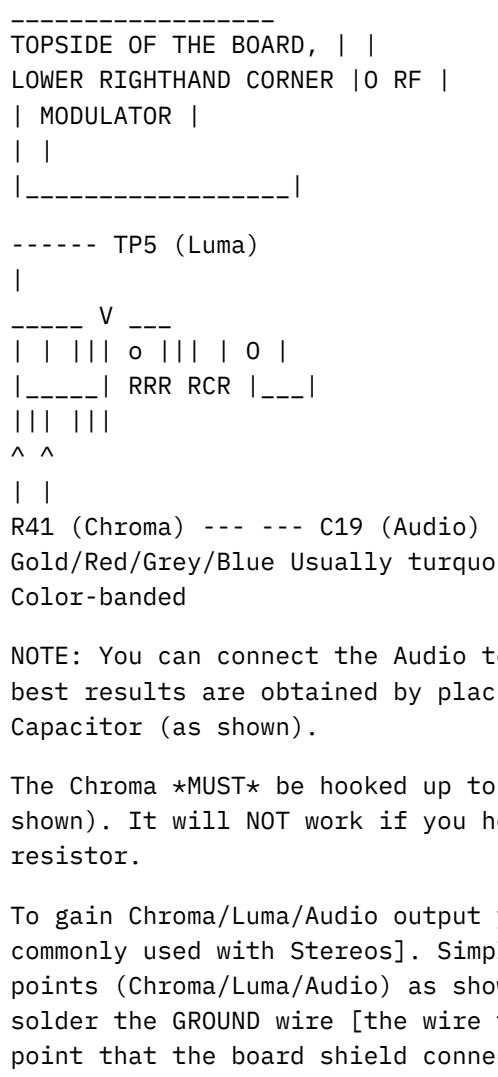
Benefits: No longer require a TV. You no longer require those god-awful
switch boxes. No more interference patterns on the screen
(from the RF cable being used as a bloody antenna). No longer
requires the 100' hookup RF cable. Crisp clear Audio etc;

Drawbacks: No longer get to see sister trip in 100' RF cable. No longer
get to fall asleep with psychedelic interference patterns on
screen.

Materials Required:
Phillips screwdriver, a soldering iron, solder, a small piece of wire,
2 or 3 patch cables and a small pair of needle-nose pliers.

* The following schematic is for the NEWER model which is sometimes referred
to as the "Atari Junior". The older model is much the same.

1-Simply unplug everything from your console, turn it over and remove the 5
screws.
2-Remove the top and bottom plastic case pieces. When removing the TOP piece
carefully pull out the ribbon cable that connects it to the main board.
3-You should now have the board (covered by a metal shield) in your hands.
Turn it over, you will see little clasps on the edge of the shield that
hold it in place. Straighten these with your pliers and you can then
remove 2 LARGE shields (One on Bottom of unit, one on Top). The
small shield remaining (On Top) covers the RF modulator.
4-Orient the exposed board into the position that it would normally be
in. ie: The way it is when you play (On/Off switch near Top Left).
5-Look in the LOWER RIGHTHAND AREA of the TOPSIDE (front) of the board.
You will see a setup that resembles the schematic below.



Gold/Red/Grey/Blue Usually turquoise Colored
Color-banded

NOTE: You can connect the Audio to EITHER side of the Capacitor, the
best results are obtained by placing it on the BOTTOM of the
Capacitor (as shown).

The Chroma *MUST* be hooked up to the BOTTOM of the resistor (as
shown). It will NOT work if you hook it to the top of the
resistor.

To gain Chroma/Luma/Audio output you will need 3 RCA patch cables [the kind
commonly used with Stereos]. Simply solder the cables at the required
points (Chroma/Luma/Audio) as shown. Remember to GROUND ALL cables! ie:
solder the GROUND wire [the wire that wraps around the inner wire] to any
point that the board shield connects to.

To gain Composite/Audio output you need 2 RCA patch cables [the kind commonly used with Stereos]. Here it gets a little different than above. Simply solder a "jumper" [a piece of wire] from R41 (Chroma) to TP5 (Luma), then connect a patch cord to TP5 [Presto! you now have composite]. Solder the remaining cable to C19 (Audio). Again, remember to GROUND all cables. Do *NOT* GROUND the jumper!

Simply re-assemble the unit and you are done. You will find that it is easier to have the newly installed cables exit through the joystick port. Alternatively, you could cut a notch in the case for a separate exit. Having the cables exit through the RF output is not recommended. There will not be enough room (without pinching the cables) to hook up the RF cable. Adjust your brightness/contrast. Enjoy!

If you ever wish to adjust your color (chroma) there is a "POT" that you can tweek. It can be found near the OFF/ON switch. It is the only pot on the left side of the board.

Well... you could automate the creating of the DLI, ie use some loop and formula to create the color data (I'm sure that must be what takes up 10k!) or have it all done manually by the user.... just allocate the memory. It's not as if you need 10k of Chr-0's to allocate the memory properly! :)

Somebody asked about the abilities of the Atari 8bits. (They had dug out one and wondered what it could do).

Well... as for the ability of the hardware as-is (ie, this is done with just the chips or with special "tricks" done in software), the Atari 8bit can do all of the following:

Graphics:
40 x 24 x 256 characters x mono
20 x 24 x 64 characters x 5 colors
20 x 12 x 64 characters x 5 colors
40 x 24 x 4 colors
80 x 48 x 2 colors
80 x 48 x 4 colors
160 x 96 x 2 colors
160 x 96 x 4 colors
320 x 192 x mono
80 x 192 x 16 greys
80 x 192 x 9 colors
80 x 192 x 16 hues
40 x 24 x 128 characters (4 colored characters with 5 colors total)
40 x 12 x 128 characters (4 colored characters with 5 colors total)
160 x 192 x 2 colors
160 x 192 x 4 colors

All modes except the 80 x 192 modes have a visible text window (even the text modes!) made out of the first mode listed (and yes, even THAT mode can have a text window with a seperate cursor and editor and all that from the normal screen.. Try POKE 703,4 and type [Clear]. POKE 703,24 to go back to normal).

Colors:
128 color pallete
256 colors total (the 16 grey mode can be in one of 16 hues)

Sprites:
4 players, 4 missles: 4 colors (each missle is its player's color)
or 5 colors (the missles are all one color, making
a "5th" player)
Players: 8 x 128 x mono or 8 x 256 x mono
Missles: 2 x 128 x mono or 2 x 256 x mono
The Player/Missle mode is either x128 or x256 (low or hi res) mode, BUT low res players CAN be moved by hires pixels to create smoother scroll-ing.

Graphics Tricks:
Display List - allows for mixing of graphics modes (each line, etc.)
Scrolling - Even each line can be set for different vertical or
horizontal or both fine scrolling. (Done with hardware).
Display List Interrupts - Allows for hardware registers to be changed
by the line (so part of the screen can have some colors and the
rest of the screen have others (making the 128 colors possible
in the higher res modes), or for "splitting" Sprites up to create
more on the screen.
Vertical Blank Interrupts - Used for good screen page-flipping (hard-
ware "looks" at a different part of RAM when displaying stuff on
the screen. Note: With DL's and DLI's the screen can be split
up to view different (or same!) parts of RAM ANYWAYS)
APAC - All Points All Colors or Any Point Any Color - Uses DLI's to
produce 80 x 96 x 256 simulated colors. Mixes the 16 grey and
16 hue modes. Added clarity (but loss of hue saturation) with
screen "dithering" (vibration)
APAC - Interlaced - A version of APAC that takes up twice as much RAM
as the largest RAM-eating screen mode to produce 80 x 192 x 256
simulated colors. Some versions allow for the grey colors to
have their own hue (just as a normal grey screen can) to produce
a screen with it's own hue but still 256 colors.
ColorView - A VERY hefty peice of work what takes up THREE times as
much RAM as the largest screens but produces an 80 x 192 x 4096
simulated color screen. Colors in this mode are usually much
better than APAC or Interlaced APAC (aka Pryzm). The screen is
made of three grey screens, one with a Red hue, one with a Green
hue, and one with a Blue hue. (16 reds x 16 greens x 16 blues =
4096 colors). Of course, the actual "HUE" of each screen can be
changed, so you really have 4096 colors out of 4096 different
screen combinations, ranging from straight 16Rx16Gx16B to
16 luminences of the same color, like 4096 greys!!!
ColorView15 - A version of ColorView that uses 160 x 192 x 4 screens
with palettes set to Reds Greens and Blues instead of the
80 x 192 x 16 grey mode screens. This produces 160 x 192 x 64
simulated colors. (Great for images made from drawings and
cartoons (from GIFs, for example).
Sound:
4 channel sound - each channel has a selection of 0-255 for pitch,
0 - 14 (evens) for "distortion" (ie "raspberry sound", "horn
sound", "normal sound", etc.), and 0 - 15 for volume.
2 channel sound - The same as above but with resolution of 0-65535 for
pitch. The modes are mixable. Either 4 channel 8bit sound,
2 channel 16bit sound, or 2 channel 8bit + 1 channel 16bit or
1 channel 16bit + 2 channel 8bit (rearranged from the previous).
Digitized sound - Not sure on specifics, but USUALLY one channel.
Nowadays, a four-channel sound player has been made (see the game
"MegaBlast I", released as FreeWare this year) and I believe it
or something like it was used (!?) in the Halle-93 demo on disk
B of the 3-disk set. (See the "Crystal Hammer" song - converted
from .MOD format!)

Printing -
High quality fonts are printable on most 9-pin printers with the use
of Daisy Dot III. Fonts can be up to 32 x 32 and width can be
doubled, tripled, and quadrupled. Height can be done the same,
but resolution is also lost using the current Font Utilities
program. Printshop fonts and graphics can also be turned into
fonts (with better vertical quality - up to 32 x 128, usually
made of multiple characters across and in graphics' case,
multiple LINES!) It is usually quite slow, and pretty hellish
with a slow (read: 80cps!) printer, but usually worth it because
of the quality. Fonts are made with an editor (but I'm HOPING
SOMEBODY out there is working on something like a TrueType or
other format -> DD3 .NLQ font converter!) A page viewer has
been made, but so far DD3 is NOT What You See Is What You Get
(WYSIWYG). Many utilities have been made, the fonts are all
Public Domain, but the program costs $25 to register. A PD
version (which does NOT allow font changing and comes with few
documents) is out.
Programming:
All sorts of BASICs, including:
Atari BASIC
BASIC XL
BASIC XE
MicroSoft BASIC II
FrOst BASIC
TurboBASIC XL
A bunch of Cs, including:
Lightspeed C
Deep Blue C
CC8
CC65
an unreleased ANSI C on cartridge! PLEASE RELEASE IT! :)
Action! - a C/BASIC/Pascal cross
Quick - a C/BASIC/Assembler Cross
A bunch of assemblers, including:
Atari Macro Assembler
Mac/65
ATMAS II
..something from Torsten Karwoth which I'm SURE is worth looking
at!..
A few Pascals, including:
Draper's Pascal
A few BASIC compilers, including:
ABC
MMG
TurboBASIC XL's Compiler and RunTime
Logo
Forth
...probably tons more languages
Device Handling:

Devices are allowed and the following are standards:
K: keyboard
C: cassette
E: editor
S: screen
P: printer
Booted from disk:
D: dos
R: RS232 handler (often used for modem, ie you'd load up the
Atari SX212 (direct-connect modem)'s R: handler and it
"pretends" to be an Atari 850 RS232 interface, but it really
just talks to the SX212 and understands the "standard" 850
commands and calls.
T: Another modem handler
M: Mouse driver! (you usually personalize your M: handler loader
specifically for colors you want, and controller used (mouse,
joystick, etc.)
All of these can be replaced, like E: for example - there is a
faster screen editor out that replaces the OS-ROM one.
DOSes!: ("D:"'s!)
This list could go on forEVER, but the most commonly used DOSes (don't
flame me if I don't mention YOUR favorite!):
Atari DOS (2.5)
DOS XE
SpartaDOS
SpartaDOS-X (cartridge) (I think DOS XE is cart. also?)
MyDOS (Atari DOS with subdirectories, built-in RAMdisk, other stuff)
TopDOS (is this used a lot?)

Well. that's a bunch of stuff about the Atari as far as nifty things are.
Again, this isn't EVERYTHING. Check an FAQ or something for REAL big
lists. The more impressive things about the Atari are:

80 x 192 x 4096 colors
4 voice digitized sound
Disk-based DOS
Ability to replace ROM-based things like device handlers

Oh yeah.. a few more notes:

Controllers:
4 or 2 (2 on newer models) controller ports
Joysticks
Mice
TrakBalls
Lightpens
Touchpads
Drawing pads (read: Koala!)
